OPEN SESSION

Friday, October 6, 2000

9 o'clock a.m.

Room 020B  
9200 Corporate Boulevard  
Rockville, Maryland

## PARTICIPANTS

Leslie Heffez, D.M.D., M.S. Chairperson  
Pamela D. Scott, Executive Secretary

## MEMBERS

Kristi Anseth, Ph.D.  
Edmond Hewlett, D.D.S.  
Janine E. Janosky, Ph.D.  
Mark R. Patters, D.D.S., Ph.D.

## CONSUMER REPRESENTATIVE

Lynn Morris

## INDUSTRY REPRESENTATIVE

Floyd Larson

## PATIENT REPRESENTATIVE

Sue Warman

## CONSULTANTS

Peter Bertrand, D.D.S.  
Marcus Besser, Ph.D.  
Richard Burton, D.D.S.  
David Cochran, D.D.S., Ph.D.  
Willie Stephens, D.D.S.

**Welcome and Introductory Remarks**

MS. SCOTT: Welcome to the meeting for the Dental Products Panel. To start off the meeting, I would like to introduce our panel for today.

Our chair for today's meeting is Dr. Leslie Heffez. He is Professor and Department Head of Oral and Maxillofacial Surgery with the University of Illinois at Chicago.

We also have with us today Dr. Kristi Anseth. She is Patten Associate Professor in the Department of Chemical Engineering at the University of Colorado.

We also have Dr. Edmond Hewlett. He is Associate Professor with the Division of Cariology and Restorative Dentistry with the University of California at Los Angeles, in the School of Dentistry.

We also have Dr. Janine Janosky. She is Assistant Professor with the Department of Family Medicine and Clinical Epidemiology within the School of Medicine at the University of Pittsburgh.

We have Dr. Mark Patters, who is Chair of the Department of Periodontology within the College of Dentistry at the University of Tennessee.

Our consumer representative for today is Ms. Lynn Morris. She is Deputy Director of the Board of Relations

1 with the California Department of Consumer Affairs,  
2 Executive Office.

3 Our industry representative is Mr. Floyd Larson.  
4 He is President of PacMed International. I have to  
5 apologize for the mistake in the program; it states Pacific  
6 Materials and Interfaces.

7 MR. LARSON: Former name; same thing.

8 MS. SCOTT: Former name; same company. Our  
9 patient representative today is Ms. Sue Warman. She is a  
10 TMJ patient, with past experience as a patient. Also, in  
11 the mid-80's she was the head for a local TMJ support group  
12 for about two years.

13 We also have with us today Dr. Peter Bertrand. He  
14 is the Director of the Orofacial Pain Clinic and specialty  
15 adviser for oral facial pain and TMD with the National Naval  
16 Medical Center.

17 We also have Dr. Marcus Besser, who is Assistant  
18 Professor in the Department of Physical Therapy at Thomas  
19 Jefferson University.

20 Also on our panel today is Dr. Richard Burton. He  
21 is Assistant Professor of Oral and Maxillofacial Surgery  
22 with the Department of Hospital Dentistry at the University  
23 of Iowa Hospitals and Clinics.

24 We also have Dr. David Cochran, who is Professor  
25 and Chair of the Department of Periodontics at the

1 University of Texas Health Science Center at San Antonio.

2 Also, we have Dr. Willie Stephens. He is  
3 Associate Surgeon for the Harvard Oral and Maxillofacial  
4 Surgery Associates.

5 Our FDA participants for today include Mr. Tim  
6 Ulatowski, who is the Director of the Division of Dental,  
7 Infection Control and General Hospital Devices. Also, we  
8 have Dr. Susan Runner, the Branch Chief for the Dental  
9 Devices Branch; and Ms. Angela Blackwell who is a reviewer  
10 within the Dental Devices Branch.

11 Before we get into the meeting, I have several  
12 administrative items to take care of. The first is the  
13 reading of the conflict of interest statement for today's  
14 meeting.

15 The following announcement addresses conflict of  
16 interest issues associated with this meeting, and is made  
17 part of the record to preclude even the appearance of an  
18 impropriety.

19 The conflict of interest statutes prohibit special  
20 government employees from participating in matters that  
21 could affect their or their employers' financial interest.  
22 To determine if any conflict existed, the agency reviewed  
23 the submitted agenda and all financial interests reported by  
24 the committee participants. The agency has determined that  
25 no conflicts exist. However, we would like to note for the

1 record that the agency took into consideration a matter  
2 regarding Dr. Willie Stephens who reported interest but no  
3 financial involvement in firms at issue. The agency has  
4 determined that Dr. Stephens may participate fully in all  
5 deliberations.

6 In the event that the discussions involve any  
7 other products of firms not already on the agenda for which  
8 an FDA participant has a financial interest, the participant  
9 should excuse him or herself from such involvement and the  
10 exclusion will be noted for the record.

11 With respect to all other participants, we ask in  
12 the interest of fairness that all persons making statements  
13 or presentations disclose any current or previous financial  
14 involvement with any firm whose products they may wish to  
15 comment upon.

16 The second item that I need to read into the  
17 record is our appointment to temporary voting status.  
18 Pursuant to the authority granted under the Medical Devices  
19 Advisory Committee charter, dated October 22nd, 1990, as  
20 amended April 20th, 1995, I appoint the following people as  
21 voting members of the Dental Products Panel for this panel  
22 meeting, on October 6th, 2000, Dr. Peter Bertrand, Dr.  
23 Richard Burton, Dr. Marcus Besser and Dr. Willie Stephens.  
24 For the record, these people are special government  
25 employees and are consultants to this panel under the

1 Medical Devices Advisory Committee. They have undergone the  
2 customary conflict of interest review. They have reviewed  
3 the material to be considered at this meeting. Signed, Dr.  
4 David Feigal, Director for the Center for Devices and  
5 Radiological Health, October 2nd, 2000.

6 At this time, I would like to turn the meeting  
7 over to our Chair, Dr. Leslie Heffez.

8 DR. HEFFEZ: I want to welcome everyone to the  
9 meeting. I would like to hold this open public hearing in  
10 an organized fashion. In order to do this, we have a number  
11 of presenters and I will ask each presenter to stick to a  
12 time limit of five minutes. If it appears that you are  
13 going to extend beyond the five minutes I will give you a  
14 little warning and interrupt your presentation. Prior to  
15 your presentation, I would like you to restate your name. I  
16 would like you to state if there is any financial interest  
17 present regarding your presentation and yourself and, in  
18 particular, if your attendance currently, today, is  
19 supported by a company or other.

20 Without further ado, I would like to start the  
21 public hearing and ask Antoinette Hosford to present.

22 **Open Public Hearing**

23 MS. HOSFORD: My name is Antoinette Hosford. I  
24 have no financial stake in the company.

25 In about 1989, I began to have three to four

1 migraines a month and my jaw would pop really loudly across  
2 the room. Then I began to have severe constant pain in my  
3 jaw all the time. Finally, after the third or fourth visit  
4 to my family doctor, telling him about the migraines and the  
5 pain, I was referred to a neurosurgeon who then referred me  
6 back to my family doctor and said I had no brain problems,  
7 who then ordered an x-ray and an MRI of my jaw and  
8 determined that I had problems with my TM joint.

9 I was sent to a dentist who tried several  
10 different programs to help me without doing surgery. We  
11 tried to splint. We tried medication. Eating with the  
12 splint, I had no relief in pain. It just gradually got  
13 worse and I could not eat hardly anything, except soft food  
14 and just liquid things.

15 We were then referred back to my oral surgeon who  
16 advised me and counseled me on having surgery with the  
17 Christensen implant. I had the surgery April 15th, 1992 and  
18 for eight and a half years have had no problem whatsoever  
19 with my jaw. I have the Fossa, the partial implant, and  
20 have just been really pleased with it. I have a friend who  
21 had two different surgeries. They were unsuccessful and I  
22 know that she is now trying to have the Christensen implant,  
23 and hopes that that will give her relief. Her husband had  
24 advised me not to have the surgery but we went ahead with  
25 it.

1 And, I am just here to let you know that I think  
2 the Christensen Fossa implant is wonderful. This is the  
3 only surgery that I have ever had. I have never had any  
4 other surgery before or after. We did try the splint and  
5 medication but they didn't seem to help at all. I couldn't  
6 open my jaw; I had migraines. Since I have had the surgery  
7 I have been really pleased with it, and I don't know where I  
8 would have been had I not had the surgery the first time. I  
9 might have had several other surgeries until coming upon the  
10 Christensen implant and I am very pleased that that was the  
11 first and only surgery that I have ever had.

12 DR. HEFFEZ: Thank you. Just for the record, was  
13 your attendance supported by the company?

14 MS. HOSFORD: No.

15 DR. HEFFEZ: Okay. The next speaker will be  
16 Charlene Jaspersen.

17 MS. JASPENSEN: Good morning, panel. My name is  
18 Charlene Jaspersen, and I do not have any financial interest  
19 in the company.

20 I am here in support of the Christensen Fossa-  
21 Eminence prosthesis. My story began several years ago. I  
22 suffered with TMJ for about fifteen years. I tried all of  
23 the conservative treatments, soft food diets, pain meds,  
24 muscle relaxants, tranquilizers, splints and three  
25 arthroscopic surgeries that did not work for me. I was

1 given a non-chew cookbook and told there is nothing else  
2 that can be done for me.

3 Then, I was given a "don't" list, and that  
4 consisted of: Don't chew gum. Don't eat hard or chewy  
5 foods. Don't clench down on your teeth. Don't sing or talk  
6 for any long periods of time. Do not do vigorous exercise.  
7 Don't chew on fingernails, pencils, bobby pins, and so  
8 forth." Don't yell or open mouth wide. Don't drink through  
9 a straw. Don't smoke. Don't carry heavy bags, purse and so  
10 forth.

11 My "do" list was: Do support your lower jaw when  
12 yawning. Do apply hot and cold compresses on the jaw. Do  
13 eat a soft diet and cut food very small. Do try to avoid  
14 stressful situations and get a good night's sleep.

15 None of these procedures relieved my pain and  
16 suffering from this debilitating disease. I was even told  
17 to learn how to live with it and make the best of it. I  
18 could not eat, smile, talk, laugh or even have my teeth  
19 worked on. Kissing my husband was such an effort and caused  
20 me so much pain. I lived on a diet of baby food, soups,  
21 mashed potatoes and so forth.

22 My family and friends had had enough of the pain  
23 and suffering I was going through. I was even giving up on  
24 life. I knew then it was time to find some answers to this  
25 TMJ pain that I was living with, and the doctor I was seeing

1 at that time told me I need not come back to him anymore if  
2 I had found another procedure.

3 I heard of the Christensen implant from a friend  
4 of mine. I then made an appointment to meet with a doctor  
5 who specialized in TMJ treatments to see if I was a good  
6 candidate for the prosthesis. In December of 1990 I had the  
7 Christensen Fossa-Eminence prosthesis implanted bilateral in  
8 place of my disk that had badly deteriorated with the  
9 rheumatoid arthritis. I am now ten and a half years postop  
10 and doing great, with no pain in the TM area. I am eating  
11 everything I want, including steaks and hamburgers, sub  
12 sandwiches. I can even eat hard candy. I have no  
13 restrictions or limitations, and I can smile and have my  
14 teeth worked on without any problems, and without my jaw  
15 locking either open or closed. I am living a normal life  
16 and I sometimes forget that I ever had TMJ.

17 In May of 1990 I had a CT scan on my jaws. My  
18 implants, the Fossa-Eminence prosthesis, looks as good as  
19 the day they were implanted. There are no loose screws on  
20 the implants and they are still in place in the disk area.  
21 My own condyles were not replaced at the time of the Fossa-  
22 Eminence implant in December of 1990. My condyles showed a  
23 slight deterioration from the rheumatoid arthritis at the  
24 time. To this date, my own condyles still look great and,  
25 in fact, they do look better than before and do not need to

1 be replaced. The Fossa-Eminence prosthesis has done the job  
2 and stopped the process of deterioration to my condyles.

3 I feel very fortunate that I have the Christensen  
4 implant as I have friends that have other types of implants,  
5 like the Vitek and Silastic and Teflon Proplast. They have  
6 caused them so much damage to their TM joint, along with  
7 pain and suffering. The Christensen implant, the Fossa-  
8 Eminence prosthesis has given me back my life. I have not  
9 had to have many multiple surgeries and I feel normal once  
10 again.

11 In closing, I would like to say I don't know where  
12 I would be today if it had not been for the Christensen  
13 Fossa-Eminence. I feel truly blessed. Thank you.

14 DR. HEFFEZ: Thank you. Miss Jaspersen, and for  
15 others who are going to present, there is a slight  
16 difference between someone having no financial interest and  
17 whether your attendance was supported.

18 MS. JASPERSEN: My attendance was not supported.

19 DR. HEFFEZ: Thank you. And, future presenters,  
20 please address those three issues. The next presenter is  
21 Ellen Lucas.

22 MS. LUCUS: My name is Ellen Lucas, and I have no  
23 financial or involvement with any other joint. You are  
24 looking at a three-time failure. Three failed total jaw  
25 joints. I know this meeting is about the all-metal

1 Christensen joint but I would like you to humor me as I  
2 discuss all three of my failed joints.

3 First, there was the Vitek VKII, and I feel the  
4 need to express to you my extreme disappointment in the way  
5 you, the FDA, has handled this failure. You allowed these  
6 joints on the market without strict safety guidelines.  
7 Then, when you discovered the horrible problems with Vitek  
8 you covered your butts by "grandfathering" in the rest of  
9 the joints instead of thoroughly checking the safety of  
10 these joints. If you had checked out these joints back in  
11 '91 and '92, we wouldn't be here right now discussing the  
12 all-metal joint problems.

13 Also, there are many people still out there that  
14 don't know that the joints in their heads have been  
15 recalled, and I know this for a fact because I have had to  
16 tell six people their joints were recalled over eight years  
17 ago, instead of the doctor telling them, and that is not  
18 fair to them or me. All you required of Amos is that they  
19 inform their patients and you haven't enforced that.

20 Now I would like to address the acrylic head  
21 Christensen. Whatever happened to this joint? It  
22 mysteriously went off the market. From what I can gather,  
23 around '93, '94, Dr. Christensen no longer provided these  
24 joints to doctors. Should I assume that he recognizes the  
25 problems with this joint? First he says there haven't been

1 wear problems with the condylar heads, but during the May  
2 11th panel sessions he admits that they wear down, but this  
3 somehow makes them better. I would like to know what is the  
4 FDA's position on this joint, and if they are considered to  
5 be bad is there anything official from FDA stating this and  
6 if there isn't, why isn't there?

7 Now I would like to discuss the all-metal  
8 Christensen joints. I want to know why this joint was even  
9 allowed on the market to begin with. Around '93 or '94, Dr.  
10 Christensen started replacing the acrylic head joints with  
11 the all-metal. He told the FDA they have been on the market  
12 for, I think, around thirty years. Where is the data to  
13 prove this? And, if there is any proof, then they were  
14 introduced after you grandfathered the existing joints in.  
15 I want to know what type of testing you have done to justify  
16 that this is a safe joint.

17 My metal Christensen caused immediate pain and  
18 swelling. This pain and swelling got so bad that the joints  
19 had to be removed last July. My op reports, which I mailed  
20 to you with my Medwatch form, says that these joints caused  
21 metalosis. If you did a thorough job of testing these  
22 joints, why was I never asked to submit my joints to you for  
23 testing?

24 I would like to know more about the green material  
25 that has been oozing out of some of thee joints. Has it

1 ever been identified and, if so, what is it? And what kind  
2 of damage to my body should I expect from this?

3 We, the public, can't afford to have another  
4 medical catastrophe caused by a bad jaw joint, especially  
5 since we see how poorly you have helped us after Proplast.  
6 If my husband performed his job as well as some of you have  
7 performed yours he probably would have been fired by now,  
8 and you guys probably make a lot more than he does.

9 I am asking you to do your job based on thorough  
10 research, not pressure from big business. If these joints  
11 are allowed back on the market without proof to me that they  
12 are safe, I will be forced to put my op pathology and a copy  
13 of my Medwatch out there on the web for anyone who would  
14 like to see it.

15 Dr. Christensen and you, the FDA, were aware of  
16 the problems with metalosis and this joint, just from what I  
17 have submitted to you. And, I would like to make one last  
18 comment. Every once in a while I get really hard on myself  
19 for foolishly allowing three bad joints to be put in me, and  
20 it dawned on me that I keep giving you, the FDA, the benefit  
21 of the doubt that you are looking out for me but you keep  
22 letting me down, and all I am asking is that you don't let  
23 me down again. Thank you very much.

24 DR. HEFFEZ: Ms. Lucas, I will invite you to come  
25 back again. You are listed twice, for Sue Schweikert.

1 MS. LUCUS: I will just say it right now, Sue is a  
2 friend of mine and she can't be here right now because she  
3 is in real bad condition right now. Her teeth are  
4 crumbling. She has had the all-metal. Like I said, she is  
5 in such a bad position that she can't attend right now.  
6 Thank you.

7 DR. HEFFEZ: Thank you. Our next speaker will be  
8 Terrie Cowley.

9 MS. COWLEY: Good morning. In 1992 I made my  
10 first visit to Congressman Ted Weiss's office --

11 DR. HEFFEZ: Excuse me, just restate your name for  
12 the record.

13 MS. COWLEY: Terrie Cowley, and I have no  
14 financial interests in any company. In 1992 I made my first  
15 visit to Congressman Ted Weiss's office to describe to his  
16 legislative staffer what I knew about the Vitek and Silastic  
17 implants. She asked me what I knew about other devices on  
18 the market and when I said, "not much," she admonished me by  
19 saying, "if you are going to be a patient advocate, you darn  
20 well better know everything about every device out there."  
21 That meeting led to the congressional hearings called, "Are  
22 the FDA and NIH Ignoring the Dangers of TMJ Implants?" and  
23 the subsequent initiation of the classification process of  
24 these devices.

25 In the eight years since that congressional visit,

1 I have made it my business to learn as much as I can about  
2 all TMJ devices. This has been facilitated because the TMJ  
3 Association has become the 911 for most patients. From the  
4 May, 1999 Dental Products Panel meeting I learned the  
5 following about the Christensen models: First, the testing  
6 data on all Christensen devices were woefully inadequate.  
7 The May, 1990 panel went on to say that evaluation of TMJ  
8 Implants clinical data was impossible as all Christensen  
9 products were blended into one reservoir of anecdotal, case  
10 study, and retrospective data, a body of haphazardly  
11 collected information without the benefit of a clinical  
12 trial protocol. Over 80 percent of the patients were lost  
13 to follow-up.

14           Regarding the devices under discussion today, the  
15 TMJ Association has heard the following problems from  
16 patients: When the Fossa-Eminence prosthesis is used, the  
17 patient suffers what surgeons refer to as condyle  
18 "shredding" or degeneration, as well as Fossa-Eminence  
19 prosthesis fracture. Of the all-metal total joint, the  
20 primary complaints we hear are metalosis, allergic reactions  
21 to the materials, and shattering of the fossa piece. Screw  
22 loosening is a complaint common to all of these devices.

23           Conspicuous by its absence at this meeting is  
24 discussion of the polymethylmethacrylate condylar head  
25 device, on the market since 1961 and, following the recall

1 of the Vitek devices in 1990, aggressively marketed.  
2 Compelling evidence of the safety and efficacy of this  
3 device was not presented at the May, 1999 meeting. The PMMA  
4 shreds, leaving a nail-like projection to abrade against the  
5 metal fossa, which can then shatter. It is apparent that a  
6 PMA for this device has not been submitted by the  
7 manufacturer and it is no longer being marketed. Where does  
8 this leave the patients who have been implanted with this  
9 device? If it is found to be unsafe, shouldn't the FDA  
10 initiate appropriate action, such as a recall, alert or  
11 warning?

12           The most troubling information revealed at the  
13 1999 panel meeting was that the manufacturer received 361  
14 MDR reports and determined that only 4 were device related  
15 and reportable to the FDA. He blamed the remaining reports  
16 on the patients and the surgeons. This is a chilling  
17 reminder to us of Dr. Charles Homsey's defense of the Vitek  
18 devices -- he blamed the patients and the surgeons for the  
19 failures.

20           Upon hearing about the number of failures, we have  
21 to ask who has the responsibility for determining the cause  
22 of failures of TMJ Implants, Inc. devices? Is it the  
23 manufacturer, someone within the company? Is it an  
24 independent monitor? Does the FDA agree with the company's  
25 definition of device failure? When the FDA learned that

1 there had been 361 failures, did the agency investigate the  
2 reports? If they found the company responsible for the  
3 majority of failures, at what number does the FDA take  
4 action: If the device failures were due to surgeon errors,  
5 shouldn't the company be responsible for better surgeon  
6 training? If the failures are the patient's fault, are the  
7 patient selection criteria wrong? Was the diagnosis  
8 questionable? Was the use of the device for the patient's  
9 TMJ problem wrong? Or, is the problem that there are no  
10 uniform guidelines for aftercare for implant patients in the  
11 oral surgery and device community? Instead, there are  
12 different directions given to patients by different doctors.

13 We know that many surgeons never file MDR or  
14 Medwatch reports. They either don't know they should or  
15 they fail to comply, or their only criterion for failure is  
16 if the device breaks. One can only wonder how many more  
17 device failures exist that have never been reported  
18 Patients hesitate to complain about their device problems to  
19 their surgeons for fear of antagonizing them. If they call  
20 the manufacturer, they are told to speak to their surgeon.  
21 If they call the FDA, the agency is limited in what they can  
22 say and patients consider it an exercise in futility.

23 DR. HEFFEZ: Ms. Cowley, you have thirty seconds.

24 MS. COWLEY: In their frustration, patients who  
25 experience local and systemic problems related to their TMJ

1 air these problems online with each other and with us. It  
2 will be interesting to learn how many TMJ implant-related  
3 devices have failed since the 1999 meeting. We have heard  
4 from 34 patients with device failure.

5 This panel has weighty matters to deliberate.  
6 Your charge is to decide whether the manufacturer has met  
7 the scientific standards of safety and efficacy demanded of  
8 jaw devices. Thank you.

9 DR. HEFFEZ: For the record, could you please  
10 state if your attendance is supported by an association or  
11 company.

12 MS. COWLEY: TMJ Associates --

13 DR. HEFFEZ: Could you speak up?

14 MS. COWLEY: I am the president of TMJ Association  
15 and we will pay for my fee.

16 DR. HEFFEZ: Thank you. Ms. Cowley, I can invite  
17 you back to the podium to speak on behalf of Beverly Miller.

18 MS. COWLEY: Ms. Wilentz will.

19 MS. WILENTZ: My name is Joan Wilentz. I am a  
20 volunteer with the TMJ Association. I am on the Board of  
21 Directors. My expenses were not paid; I am local, and I  
22 have no financial interest.

23 DR. HEFFEZ: May I ask you just to speak more  
24 directly into the microphone? Thank you.

25 MS. WILENTZ: This is a letter from a TMJ implant

1 patient in Memphis, Tennessee, Beverly Miller. Dear Panel,  
2 everyone I know with a Christensen device has had either the  
3 head crack, the device break, screws come out. They have no  
4 end of surgeries, pain, suicidal thoughts and attempts,  
5 bankruptcy, family breakups, doctors no longer wanting to  
6 see the patients. They find disability very hard to come by  
7 and there have been no recalls. Ford and Firestone have  
8 worldwide recalls on the tires that have caused about 60  
9 deaths. When are you going to have recalls on the TMJ  
10 implants that have caused hundreds of deaths and  
11 disabilities?

12 Beverly sent a photo that she would like the panel  
13 to look at. I will pass it around. This is the head of a  
14 TMJ implant where the screws came out; the shaft broke; the  
15 acrylic head broke through the patient's cheek. She  
16 developed two staphylococcal infections in her head, had to  
17 travel to another state to have surgery to have the implants  
18 removed. Her doctor refused to do further surgery to  
19 replace the implants after the staphylococcal infections had  
20 cleared up because she is now disabled and Medicare will not  
21 pay sufficient funds. She does not have the \$10,000 cash to  
22 pay up front. Today she has no joints.

23 Please have all TMJ implants go through the  
24 strictest of testing and do not put others in this  
25 situation. One day it may be someone you love. Thank you,

1 Beverly Miller.

2 This is the picture of the patient with the  
3 protrusion of the joint implant through the skin. I will  
4 pass it around.

5 DR. HEFFEZ: Just for the record, you are here  
6 representing --

7 MS. WILENTZ: TMJ Association.

8 DR. HEFFEZ: The Association or Beverly Miller?

9 MS. WILENTZ: Well, I was asked by the Association  
10 to read the letter that came to the panel from Beverly.

11 MR. ULATOWSKI: Mr. Chair, I want to make it clear  
12 that each entity has one opportunity to speak, and the  
13 understanding that you spoke for the patient and not again  
14 for the Association, that is permitted but each entity has  
15 one shot.

16 DR. HEFFEZ: Thank you. I will invite Dr. Doran  
17 Ryan.

18 DR. RYAN: Good morning. I am Dr. Doran Ryan. I  
19 am not representing anyone but myself. My trip was paid for  
20 by myself, except I had breakfast paid for by TMJ Concepts.  
21 I had breakfast with them this morning.

22 I want to thank you for the opportunity to address  
23 this panel regarding the all-metal total joint prosthesis of  
24 TMJ Implants, Inc. I am an oral and maxillofacial surgeon  
25 in private practice, in Oshkosh, Wisconsin. I am also

1 president of the American Society of Temporomandibular Joint  
2 Surgeons. I have published numerous articles regarding the  
3 use and disuse of alloplastic implants in the  
4 temporomandibular joint. I have had the opportunity to do  
5 research on implants in animals both to find the results and  
6 the uses of these implants.

7 I really represent the oral maxillofacial surgeons  
8 who practiced during the Proplast Teflon era and has  
9 witnessed the pain and suffering of over 10,000 patients who  
10 had FDA approved Proplast Teflon placed in their  
11 temporomandibular joints. Many of those patients continued  
12 to suffer even after removal of those implants. In the  
13 early 1980s the FDA approved the Proplast Teflon as safe and  
14 effective for the use in the temporomandibular joint even  
15 though no independent testing of the product, nor any  
16 controlled clinical trials were established. The FDA relied  
17 on undocumented information from the company, that being  
18 Vitek.

19 In 1986, six years after the Proplast Teflon  
20 started to be used, I wrote a letter to Dr. Singleton of the  
21 FDA and to the editor of the Journal of the Oral  
22 Maxillofacial Surgery. I recommended the product not be  
23 used; all the patients be recalled and evaluated for removal  
24 of the implant. I had animal research to back up these  
25 recommendations. At least ten doctors wrote rebuttals to

1 Dr. Singleton and to the Journal. The implants were working  
2 for them and I was wrong. They claimed the problem was the  
3 technique and not the product.

4           Unfortunately, it was more than six years before  
5 the FDA acted on the recommendations, with the debate  
6 finally ending in 1992. The law suits continue today  
7 against the doctors. Patients continue to suffer, and the  
8 FDA did say they were sorry.

9           How quickly we forget. Now, in the year 2000 we  
10 are faced again with a novel approach to the reconstruction  
11 of the temporomandibular joint, that is the all-metal total  
12 joint. Is this product safe and effective? And, will it  
13 pass the test of time? I don't know that answer, but I  
14 don't think the FDA does either.

15           Here are the reasons why I question the approval  
16 of this product: There is no history of metal-to-metal  
17 temporomandibular joints. This is truly a new idea. Two  
18 articles were published, one in 1997 and the other in 1998,  
19 in a non-refereed book with the manufacturer as one of the  
20 co-authors. The mean follow-up time was 7.5 months and 26  
21 months. Keep in mind, we didn't acknowledge Proplast Teflon  
22 failures for 8 years. That means we almost have 5 years of  
23 debt on this product. I have not seen any published  
24 controlled clinical studies with this product.

25           The only other joint in the body using metal-to-

1 metal total joints is the hip. It is a constrained joint,  
2 unlike the temporomandibular joint. The knee is closer in  
3 function and metal total joints are not used in the knee.  
4 The metal-to-metal hip joint failed in the '60s and '70s.  
5 Failure was attributed to poor control of sphericity,  
6 inadequate radial clearance via matched head and cup pairs,  
7 and unpredictable cobalt chrome molybdenum microstructure  
8 secondary casting of the metal. This led to two and three-  
9 body wear. Excessive wear, metal fatigue and corrosion led  
10 to ultimate failure.

11 New guidelines, published by the American Society  
12 of Testing and Materials, include the following: The fossa  
13 and condyle need to be well matched and spherically  
14 controlled. As the difference in the radius increases,  
15 point contact occurs and a new product can lead to excessive  
16 wear. Cobalt chrome molybdenum is more homogeneous and  
17 stronger than cast metals, which is the way this product is  
18 made. The fossa used in the system is cast metal, which is  
19 very thin, and combined with the point contact with the  
20 system has been shown to fracture.

21 The question of independent evaluation of this  
22 product must be answered. Who is independent, and does the  
23 testing follow the standards? I remember vividly being told  
24 by the manufacturer that acrylic on the condyle of the  
25 previous total joint of TMJ Incorporation didn't wear -- no

1 wear. We all know that that is not true. I was shown  
2 independent studies that demonstrated this fact. Yet, we  
3 know that the acrylic condyle did, and still does, wear.

4 Now the same company is offering up a new all-  
5 metal-to-metal total joint with, the best I can tell, five  
6 years of uncontrolled data. Have they followed the  
7 published guidelines of testing this material, and who is  
8 doing the testing?

9 DR. HEFFEZ: Dr. Ryan, you have thirty seconds.

10 DR. RYAN: I do not know those answers, but I know  
11 that you need to look very closely at that data. In  
12 conclusion, I hope I am wrong about this product and I hope  
13 that it does not fail but, please, don't give us another  
14 Proplast Teflon clone. Most importantly, please do not  
15 sentence more patients to a life of severe chronic pain and  
16 suffering because power and money is placed in front of  
17 science and research. I hope that this time if the product  
18 fails the FDA will take responsibility for their action and  
19 not just say, "I'm sorry," and leave the results of failure  
20 for others to manage. Thank you for your time and  
21 attention.

22 DR. HEFFEZ: Thank you. The next presenter  
23 invited to come to the podium is Michael Billingsley.

24 DR. BILLINGSLEY: Good morning, ladies and  
25 gentlemen. I am Dr. Mike Billingsley. I am a private

1 practice oral and maxillofacial surgeon from Colorado  
2 Springs, Colorado.

3 I am here to support the application --

4 DR. HEFFEZ: Could you please state your financial  
5 interest.

6 DR. BILLINGSLEY: Oh, yes. I am here to support  
7 the application for FDA approval for the Christensen Fossa-  
8 Eminence prosthesis manufactured by TMJ Implants,  
9 Incubation. My travel expenses were reimbursed by the  
10 company but I am not a stockholder and have no other  
11 financial interest in the company.

12 I represent a group of eight private practice oral  
13 and maxillofacial surgeons based in Colorado Springs, with  
14 satellite offices in Pueblo, Trinidad, Canyon City and  
15 Castle Rock. Our service area includes a population of  
16 nearly 750,000 in southern Colorado and northeastern Mexico.  
17 Our TMJ referrals come from a large base of dental practices  
18 and a number of physicians involved in chronic pain  
19 management.

20 Most patients referred to our group have an  
21 extensive history of non-surgical care by the time we see  
22 them, including medications, bite splints, physical therapy  
23 and psychological management. Some are under the care of  
24 orthodontic and prosthodontic specialists. In an average  
25 year, about 75 patients receive surgical evaluation in our

1 practice for their TMJ and dysfunction complaints. A  
2 thorough diagnostic protocol is observed, including  
3 extensive history and physical, response to prior treatment  
4 and x-rays and MRI evaluation.

5 Of this group, approximately 15-20 patients are  
6 identified each year as surgical candidates. Most are  
7 offered arthrocentesis if surgery is indicated, which has  
8 been a useful diagnostic and therapeutic aid for many  
9 patients. This is followed by at least 3-4 more months of  
10 non-surgical care with splints and physical therapy.

11 Out of this group, usually 8-10 in a year will  
12 still be found to have painful dysfunction and are offered a  
13 surgical arthrotomy. Now, the decision to operate requires  
14 the patient have continued painful dysfunction in spite of  
15 non-surgical or arthrocentesis care, with clinical and MRI  
16 evidence of internal disk arrangement and Wilkes categories  
17 III or higher.

18 There are patients who have failed non-surgical  
19 and arthrocentesis therapies in most cases, but the final  
20 determination for diskectomy and placement of a Fossa-  
21 Eminence prosthesis is reserved for the time of surgery,  
22 when the disk and associated tissues can be directly  
23 observed. If the disk is found to be anteriorly and  
24 medially displaced, perforated or tightly bound down with  
25 fibrous adhesions, and on repositioning of the disk is found

1 to be contracted with inadequate space between the anterior  
2 and posterior bands of the disk, this, to us, is a clear  
3 indication for disk removal and placement of a Fossa-  
4 Eminence prosthesis.

5           Using the stock templates, our doctors have always  
6 been able to achieve a good Fossa-Eminence fit, except in  
7 rare cases of severe bone destruction which requires a  
8 custom fossa prosthesis designed on the cadcam model. After  
9 selection of the proper size implant, the final Fossa-  
10 Eminence prosthesis is inserted. The dental occlusion and  
11 joint function are carefully checked, and the device is  
12 secured at the lateral aspect of the zygomatic base in the  
13 eminence with chrome cobalt screws. Following surgery, the  
14 patient is immediately placed on physical therapy to prevent  
15 early development of joint adhesions, and splint management  
16 is continued and the patient is carefully followed.

17           Our experience since 1991 with these devices  
18 includes over 80 Fossa-Eminence Prosthesis placements in 50  
19 patients, and in this group 5 cases include total joint  
20 reconstruction with the condylar prosthesis, including 1  
21 cadcam-base custom prosthesis. The total joint cases were  
22 in trauma, tumor and rheumatic arthritic situations. To  
23 date, no Fossa-Eminence Prosthesis only cases have required  
24 subsequent placement of the condylar prosthesis. Our  
25 success rate is over 90 percent based on our criteria of 35

1 mm of pain reduction from the usual level of 8 or higher on  
2 the VAS scale down to less than 2.

3 No major complications have been observed due to  
4 the device itself. In two cases, patients had implants  
5 removed by other surgeons but we were not provided with  
6 either the reason for explantation or any evidence of  
7 pathology related to the Fossa-Eminence Prosthesis.

8 DR. HEFFEZ: You have thirty seconds.

9 DR. BILLINGSLEY: One of the patients eventually  
10 proved to be emotionally unstable and has continued to seek  
11 multiple surgeries. Two patients, in the initial placements  
12 early on, required replacement with larger prostheses due to  
13 range of motion limitations, and have subsequently done  
14 well. One loose screw was removed under local anesthesia  
15 with no further problems. We have observed condylar surface  
16 remodeling in some cases on follow-up x-ray but no condylar  
17 resorption has been seen.

18 In conclusion, our experience with the Fossa-  
19 Eminence Prosthesis has been very rewarding. This device is  
20 extremely valuable in the surgical management of articular  
21 disk disorders and early degenerative disease.

22 DR. HEFFEZ: Your time is up.

23 DR. BILLINGSLEY: Thank you.

24 DR. HEFFEZ: I will invite the next speaker, Dr.  
25 Joseph Niamtu.

1 DR. NIAMTU: Good morning. My name is Dr. Joe  
2 Niamtu. I am a private practice oral maxillofacial surgeon,  
3 in Richmond, Virginia. I have no financial interest in the  
4 company. I have been asked by TMJ Implants to relate my  
5 experience with their fossa-eminence product, and I have  
6 been reimbursed for my expenses from Richmond to Washington.

7 Basically, there is no perfect device out there  
8 for temporomandibular joint disorders. If you look around  
9 this room on both sides, there are a lot of very eminent  
10 people here academically that have a lot of experience with  
11 this. As a practitioner in private practice looking for  
12 solutions, you can go around the country and you can talk to  
13 some of these very important people and you hear always do  
14 this; never do this -- there really is not one thing to do,  
15 and some things work real great in some people's hands and  
16 other things don't work well in other people's hands and  
17 there is a quandary.

18 We have a lot of patients. There are ten million  
19 patients that have TMJ problems and five percent of these  
20 patients will eventually be surgical candidates, and we  
21 don't have a lot of solutions; we don't have a lot of  
22 devices.

23 We have certainly learned lessons in the past from  
24 the Teflon Proplast, and there have been mistakes. But,  
25 basically, I want to just relate, firstly, my experience in

1 the private practice trenches using the fossa-eminence  
2 system, not the total joint; not the condyle but the fossa-  
3 eminence. I have placed about a hundred of these and,  
4 basically, I have been in practice for almost twenty years  
5 and I have counted about fifteen materials that I have put  
6 in the joint because at any given point in time that was  
7 something that was purported as good, or the next best  
8 thing, or what was going to help patients, and it has been a  
9 confusing situation.

10 I can only say that about a decade ago I was told  
11 by some of my friends that were using the fossa-eminence  
12 system that it was a viable alternative, and they were  
13 seeing good results in their patients. And, I started using  
14 this. The first one I put in was in about 1991. This  
15 patient is doing well. I can't say that none of these  
16 patients has ever had problems because there are a lot of  
17 variables when you put anything in or operate on any  
18 patient.

19 As a surgeon, when you choose to operate on  
20 somebody, anybody who is honest will admit that they have  
21 done possibly the wrong operation; they have chosen the  
22 wrong patient; they have not put the device in correctly.  
23 In my home town, I say, you know, I have had good experience  
24 with this. There are other surgeons who have used this  
25 product and they haven't had good experience. I think a lot

1 of it has to do with the learning curve and putting it in  
2 right, just like any device.

3 But when patients come to you, and if you see a  
4 lot of TMJ patients, by the time they get to you as a  
5 surgeon they are at the end of their rope. They are at  
6 their wits end. They have these horror stories. Some of  
7 these people want to kill themselves and, you know, they  
8 look you in the eye and they say, "what can you do for me?  
9 How can you help me?" And, there are just not a lot of  
10 alternatives.

11 I have used this fossa-eminence system. I have  
12 had good results with it. It has been an alternative.  
13 These patients have been able to open and close. It has  
14 helped their pain. Nobody is going to get cured. These  
15 people aren't going to get cured. They are going to have  
16 problems all their life because that is the nature of TMJ  
17 problems. But, I have not had to take these out. I have  
18 taken a few out and some of those may have been my fault. I  
19 may have technically not done it right and I may have put  
20 the wrong joint in the wrong patient -- the wrong eminence,  
21 but basically I have never had a loose screw from this  
22 fossa. I have never had a failure because of material. I  
23 have gone back and had to open up these joints to clean them  
24 out from time to time. I have never seen any significant  
25 resorption, and I have not seen significant condylar

1 resorption that some people state that they have seen.

2           Basically, in my hands this has worked well and it  
3 has been a good alternative, but I will tell you that for  
4 the last year and a half I have been kind of stonewalled  
5 because I have patients that I can't offer this to, and I  
6 would ask you to consider seriously about putting the fossa-  
7 eminence back on the market. I basically have people  
8 waiting because I don't really know what to do.

9           Again, I think a lot of it boils down to what  
10 works well in your hands as a surgeon, and probably you  
11 could bring fifty people in here and talk about something,  
12 whether it was cartilage or repositioning of the disk, or  
13 this joint or that joint and, you know, it may work well in  
14 their hands and it may really serve their patient population  
15 without any bad situations. Basically, I just want to  
16 relate to you that, by and large -- and I try to follow my  
17 patients very closely, they have had good experiences with  
18 this and, obviously, I wouldn't still be using it if I  
19 didn't have good experiences. Again, it is really important  
20 and I don't think anybody that can come up to this  
21 microphone that operates on people can say that everything  
22 always works well and they don't have problems because this  
23 is a confusing disease process.

24           If you look at the National Institute of Health  
25 Technical Assessment Conference data, there are a lot of

1 people out there with TMJ problems. We have all learned  
2 that you don't operate on people unless they have  
3 significant joint pathology, but there are a lot of people  
4 that come to me and other oral surgeons and they do have  
5 significant joint pathology, and what are our choices? You  
6 can't just tell these people -- you know, some people you  
7 can just tell them, "hey, if you just wait twenty years it's  
8 going to go away," but there are people -- like you heard  
9 today, their jobs are affected; their marriages are  
10 affected; their whole life is affected by this chronic pain  
11 and I think that I have been able to help a considerable  
12 population of these patients by using this device. So, I am  
13 just here to say that that has been my experience. I have  
14 not seen these negative effects that I have heard today, and  
15 this patient population has done well with this device.  
16 Thank you.

17 DR. HEFFEZ: Thank you. The next speaker invited  
18 is James Bergeron.

19 MR. BERGERON: My name is James Bergeron. I have  
20 no financial interest in the company. I have no support  
21 from them.

22 I want to thank you for giving me the opportunity  
23 to present before you on the review of the premarket  
24 approval application of the TMJ Fossa-Eminence Prosthesis,  
25 manufactured by TMJ Implants, Inc., by the Food and Drug

1 Administration.

2 My name is James Bergeron and I am the legislative  
3 director for Congressman Tom Tancredo. Congressman Tancredo  
4 represents the sixth congressional district of Colorado,  
5 which includes the southern and western suburbs of Denver,  
6 including Golden, Colorado, the headquarters of TMJ  
7 Implants. All of the current employees of TMJ Implants are  
8 constituents of the Congressman, and most of the employees  
9 who have been laid off by the company since this lurid tale  
10 began, more than a year ago, are constituents as well.

11 Now, the Congressman apologizes for the fact that  
12 he cannot be in attendance today because of legislative  
13 business on the floor. He, nonetheless, has taken an active  
14 interest and an active role in monitoring the progress of  
15 TMJ's implants application.

16 On numerous occasions he has met with Dr.  
17 Christensen, president of TMJ Implants, to find out  
18 information about the approval of the partial and total  
19 joint, and has personally talked to Commissioner Jane Henney  
20 and to members of the agency about the status of the  
21 company's applications. Congressman Tancredo has also been  
22 in contact with the House Commerce Subcommittee on Oversight  
23 which has sole jurisdiction over the FDA and issues relating  
24 to abuse and the internal operations of the agency.

25 Specifically, the Congressman has been closely

1 following this case since our office's first contact with  
2 Dr. Christensen and TMJ Implants in May of 1999.  
3 Incidentally, it was at this time that a meeting of the  
4 FDA's Dental Products Panel was held to review the company's  
5 PMA, and recommended approval of the PMA by a 9-0 vote.  
6 However, in spite of this action, it has not been lost on  
7 the Congressman that TMJ Implants finds itself in roughly  
8 the same spot today due to the actions or inactions of the  
9 agency. As such, I want to not only express Congressman  
10 Tancredo's support for the approval of TMJ Implants' partial  
11 PMA -- that is, after all, why we are here, and his desire  
12 that the Dental Products Panel approve the PMA much the same  
13 as it did in the 1990 panel, but also to express his  
14 concerns publicly about the process, and public health  
15 issues which accompany this application.

16 First and foremost, it is the Congressman's hope  
17 that the advisory panel will keep an open mind and listen  
18 carefully to the data that the company is presenting for the  
19 partial, for it meets the standard for reasonable  
20 assumptions for safety and effectiveness.

21 Next, the Congressman believes that the process  
22 has gone awry, and is concerned about the public health with  
23 the partial joint being withdrawn from the market.

24 On the process, I am sure you will hear the  
25 problems that the company has experienced from those after

1 me. It is no secret from all involved that there have been  
2 significant questions raised about the process, the sluggish  
3 pace of the review of the engineering data for both the  
4 total and partial joint and, more importantly, the constant  
5 moving of the goal posts during the review of both PMAs.

6 I sincerely believe that most of the frustration  
7 that has been expressed here could have been avoided had  
8 everyone sat down and laid everything out on the table in  
9 the spirit of what was fought for under the FDA  
10 Modernization Act. Unfortunately, the agency has been  
11 unwilling to do so, and it seems like these problems will  
12 continue into the foreseeable future. Thus, I will raise a  
13 question that others will raise as well as to why a new  
14 panel was needed. The May 1990 panel knew exactly what it  
15 was voting for. In fact, the panel was specifically told  
16 that it was voting whether to approve the PMA before it.

17 Now the public health concerns -- it appears that  
18 in an effort to address safety, and I am told that in this  
19 case the bar has been raised to a level significantly out of  
20 the ordinary, well beyond the statutory standard of  
21 reasonable assurance of safety and effectiveness. Because  
22 of this, the agency has done nothing more than cause harm to  
23 patients. It has failed to address the needs of the special  
24 patient population that is now suffering from the disorder  
25 and logically can be remedied without waiting until

1 degeneration of the total joint calling for irreversible  
2 surgery. Based upon history and data provided by the  
3 company, the device, which has a thirty-year clinical  
4 history, should not have been removed from the market. The  
5 fact is that the safety concerns are suspect and a health  
6 hazard has been created by the removal of the partial joint  
7 from the market.

8           You should know that the FDA, in August of 1998,  
9 made a finding of public health necessary for this partial  
10 device and, mysteriously, nine months later threatened  
11 denial of the company's PMA unless the partial was withdrawn  
12 from the market and in spite of receipt of significant  
13 additional data supporting FDA's own findings.

14           Over the last year and a half, our office has  
15 received numerous letters from physicians all across the  
16 country, from the Mayo Clinic to the University of Maryland,  
17 each relating to us the benefits of the partial joint and  
18 the fact that the partial and total joint results in  
19 immediate and dramatic decrease in pain, an increase in  
20 range of motion and increased function. Surely, the  
21 thoughts of these esteemed surgeons cannot be ignored,  
22 cannot be swept under the table.

23           The Congressman is concerned about what has  
24 happened here for this device is not available to clinicians  
25 that have made it clear that it is helpful. All of this

1 calls into question the integrity of the agency, something  
2 that the Congressman finds very disturbing.

3 Dr. Christensen is a true professional and a  
4 pioneer in his field and holder of the first patents. His  
5 implants are widely acceptable as effective and safe  
6 throughout the dental and surgery community. Indeed,  
7 several of my constituents have literally had their lives  
8 changed by the procedure. Congressman Tancredo is convinced  
9 that the work of the TMJ is based on solid scientific  
10 principles, and removal of the implants from the market has  
11 been, and continues to be, erroneous, contrary to the  
12 agency's earlier findings and the standard that should be  
13 applied. This has been devastating to thousands of people  
14 in the general public. This disaster must be remedied as  
15 soon as possible. Thank you.

16 DR. HEFFEZ: Thank you. At this time, I would  
17 like to ask if there are any other speakers who didn't sign  
18 in or signed in, in a delayed fashion and would like to  
19 present? No response from the floor.

20 At this time, I will ask panel members if they  
21 have any specific questions they would like to direct to one  
22 of the presenters. State your name.

23 DR. BERTRAND: I am Peter Bertrand, from the Navy.  
24 For the gentleman from Richmond, I was curious about your  
25 patient selection. Are these patients with fully

1 degenerated joints, or are these patients with internal  
2 derangements who have not responded to so-called  
3 conservative therapy?

4 DR. HEFFEZ: Please restate your name.

5 DR. NIAMTU: Dr. Joe Niamtu, private practice oral  
6 maxillofacial surgery, Richmond, Virginia. Basically, I  
7 think the standard of care that exist for temporomandibular  
8 joint disorders -- I think anybody who treats TMJ patients  
9 has a responsibility, before you lay a scalpel on a joint,  
10 to make sure that you have done everything for that patient  
11 because of what can happen from surgery -- any surgery.

12 Basically, you know, most of the time by the time the  
13 patients get to many oral maxillofacial surgeons like  
14 myself, they have gone through all the conservative therapy  
15 with their primary treating physician and/or dentist.

16 I believe what you are asking me is what pathology  
17 I am looking for, or am I just using internal derangement.  
18 Internal derangement means a lot of different things to a  
19 lot of different people. When I explain it to patients I  
20 tell them that the innards of their joint are just not  
21 working in harmony; they are not working well. And, you can  
22 argue all day about what it is and what it isn't but, to  
23 finally answer your question, basically I look for the  
24 clinical signs. Most of the patients that I am operating on  
25 require a diskectomy. The far majority of them either have

1 significant perforations, or very significant areas of  
2 thinning that will eventually be a perforation, of the disk  
3 is just very hypertrophic and in some cases hypoplastic.  
4 These people open and close and it sounds like they have  
5 gravel in their joint. I mean, to me, this has been a  
6 pretty consistent clinical sign. When they open and close,  
7 it kind of gives you goose bumps -- "I'm glad my jaw doesn't  
8 hurt like that."

9           One of the big indicators I think is the position  
10 of the disk on MRI, although we all know that that is not a  
11 sole indicator but certainly these other clinical symptoms,  
12 this type of pain, limited opening, the crepitus and joint  
13 noise, and displaced disk or perforated disk -- all these  
14 things add up.

15           I think the biggest mistake a surgeon can make is  
16 just operate on somebody because the patient wants an  
17 operation or because nothing else works. I think people who  
18 do TMJ surgery -- you know, you come to a point where you  
19 learn who not to operate on and that is a significant thing.  
20 So, I think the presence of demonstrable pathology  
21 clinically and on imaging studies, and/or from previous  
22 invasive procedures like arthroscopy. Sometimes you will  
23 look in a joint and it is just beat up badly. So, this is  
24 what I use personally to make my decision, and I can  
25 honestly say that these people have been marched through a

1 progressive cascade of conservative treatments before  
2 becoming surgical candidates.

3 DR. HEFFEZ: Thank you.

4 DR. NIAMTU: Did I answer your question?

5 DR. BERTRAND: For the most part. Do you ever  
6 anesthetize the joint before you do your surgery to verify,  
7 other than the patient's opinion, that it is actually the  
8 pain source?

9 DR. NIAMTU: Yes, diagnostic blocking is a  
10 significant part of our situation. Again, I think most  
11 surgeons look for an excuse not to operate on somebody. I  
12 really do because, you know, you can really help somebody  
13 and you can open a can of worms. On almost all of these  
14 patients we will do arthrocentesis, usually in the office  
15 where we will use Marcaine to anesthetize this joint. We  
16 will place two needles in to rinse out this joint, and we  
17 will frequently put some type of corticosteroid in there.  
18 You know, doing the diagnostic block -- for the people who  
19 are non-clinicians here, one of the hardest things for a  
20 surgeon is to understand is this a muscle problem, is it a  
21 neurologic problem, or is it actually a joint problem. That  
22 is the confusing diagnosis here. I think that this has  
23 brought light to this situation. I don't think it is a  
24 hundred percent effective but I certainly think it gives you  
25 information on which to choose to operate or not operate.

1 DR. BERTRAND: Thank you.

2 DR. HEFFEZ: Any other questions from the panel?

3 DR. STEPHENS: I am Willie Stephens. I have a  
4 question I would like to pose to Dr. Ryan. I was wondering  
5 if you might speak for a moment about your thoughts about  
6 treating patients who have failed previous alloplastic  
7 surgery, and whether you have concerns about putting another  
8 prosthesis in that has a plastic wear debris.

9 DR. RYAN: Well, as we know and it has been  
10 published, after two and a half surgeries or two to three  
11 surgeries, most of these patients are going to fail any  
12 procedure we do. It is unfortunate that we don't have a  
13 better way to treat those patients. So, the patient who has  
14 had multiple surgeries many times have central pain. They  
15 really don't have peripheral pain that you can operate on.  
16 So, those patients are essentially chronic pain patients  
17 from that moment on.

18 What we try to do on those patients is reestablish  
19 function for that patient. Essentially there are two  
20 components we have to deal with, one is pain and one is  
21 function. Many times we cannot help their pain because it  
22 is now central pain and has to be treated medically. So,  
23 now we have to deal with the functional component of their  
24 problem, which is getting back to where they can at least  
25 chew and talk normally. In that case, we need some type of

1 alloplastic material in order to treat these patients.

2 Patients who have had multiple surgeries end up  
3 with very poor blood supply to the joint. So, autogenous  
4 material or natural tissues don't heal well in that joint.  
5 So, we need some type of alloplastic material. I think the  
6 thing that we need to look at is what is the best material  
7 to put in that joint that will cause the least wear debris -  
8 - everything is going to wear that we put in the joint.  
9 What material can we put in there that will cause the least  
10 amount of wear debris? Of that wear debris, which one of  
11 those particles that are produced will cause the least  
12 amount of reaction in the body?

13 So, I certainly think there is a place for an  
14 alloplastic material in the joint, but we certainly need one  
15 that has very little wear debris and one that does not cause  
16 further damage after it does wear. The problem in the past  
17 has been that we have not come across that. Acrylic in the  
18 past has been shown to be a problem in the hip joint, and  
19 that is a concern. Metalosis is certainly a problem, and  
20 you put metal-on-metal and you are going to end up with some  
21 problems because it wears, and it wears down fairly rapidly  
22 if it has point contact. So, I hope that answers your  
23 question.

24 DR. STEPHENS: If you have to do a joint  
25 replacement in a patient with a failed Vitek now, what would

1 you use at this point?

2 DR. RYAN: I am using TMJ total joint prosthesis  
3 which, as you know, is high molecular polyethylene and metal  
4 condyle against that, similar to the other joints in the  
5 body.

6 DR. HEFFEZ: Dr. Patters?

7 DR. PATTERS: Mark Patters. A question for Dr.  
8 Ryan and perhaps any of the other surgeons that spoke. I  
9 perceive that the patients and their representatives are  
10 implying that patients who are not successful lose  
11 confidence in their surgeon; lose confidence in the system;  
12 and are lost to follow-up and therefore, the success data is  
13 skewed because those patients returning for follow-up are  
14 happy and those are not returning are very unhappy. What is  
15 your personal experience and would you agree that that is a  
16 concern?

17 DR. HEFFEZ: State your name, Dr. Ryan.

18 DR. RYAN: Yes, I am Dr. Doran Ryan, from Oshkosh,  
19 private practitioner. I think that is probably true. I  
20 think what happens is there is frustration on both sides.  
21 The patients become frustrated with the fact that they still  
22 have pain and still have trouble with function, and the  
23 surgeon who placed the implants becomes very frustrated  
24 because the patient has not done well also. So, at some  
25 point that bond is broken between the surgeon and the

1 patient, and the patient wanders off to look for some other  
2 source of help. That has happened to me. I have patients  
3 that have wandered off, and I think I try to treat my  
4 patients very well but there is a certain frustration that  
5 everyone develops and, therefore, that bond is broken. They  
6 do. Patients do wander off and for that reason it is very  
7 difficult to track these patients and find out exactly the  
8 success rate, and we have proven that over and over again  
9 when we have looked in the literature and we find that in  
10 the temporomandibular joint everything had a 90 percent  
11 success rate, yet, we know that is not a fact. As time went  
12 on, we found out that many of those procedures had much less  
13 than that, sometimes less than 50 percent. So, they do get  
14 lost to follow-up for that reason.

15 DR. BILLINGSLEY: I would like to address one  
16 point, if I may.

17 DR. HEFFEZ: Restate your name in the microphone.

18 DR. BILLINGSLEY: Dr. Mike Billingsley, Colorado  
19 Springs, private practice of oral maxillofacial surgery.  
20 Our experience with Proplast Teflon patients has been  
21 limited but we have about a dozen patients in our follow-up  
22 group who had Vitek implants at one time. We did see some  
23 destructive changes in these patients, and followed them and  
24 recommended that they be removed, and we did replace them,  
25 all but one who refuses surgery, with the Fossa-Eminence

1 Prosthesis and they have uniformly done well without further  
2 decline of their condyles.

3 One thing that is extremely important is proper  
4 debridement of the joint in that situation because any  
5 particles left will continue to propagate the giant cell  
6 reaction against the particles of the Teflon. So, we think  
7 not every joint that needs to be opened that has a disk  
8 removed needs a total joint. This is an extremely expensive  
9 undertaking and fraught with many hazards, much less  
10 predictable, and in most cases it can be managed with the  
11 Fossa-Eminence Prosthesis.

12 DR. PATTERS: Thank you.

13 DR. COCHRAN: David Cochran. I would like to know  
14 from the physicians that have spoken what the percentage --  
15 realizing that this is a cascade for many of these patients  
16 to get to the point they are at, what is the percentage of  
17 patients that you actually operate that have a condyle that  
18 is still intact enough to not use a total joint replacement  
19 and only the fossa?

20 DR. HEFFEZ: Specifically who are you addressing  
21 the question to?

22 DR. COCHRAN: Any of the oral maxillofacial  
23 surgeons who have spoken.

24 DR. HEFFEZ: So, Dr. Niamtu is the closest.

25 DR. NIAMTU: Dr. Joe Niamtu, Richmond, Virginia.

1 Can I answer the second half of his question or just the  
2 question that is on the floor?

3 DR. HEFFEZ: Answer the question on the floor,  
4 please.

5 DR. NIAMTU: Okay. Basically, what percentage of  
6 these joints have condylar damage? In my experience, very  
7 few of them. This is mostly for a disk problem. As I  
8 stated earlier, I can't say that none of these joints don't  
9 have some arthritic change on the condyle or an occasional  
10 osteophyte but, by and large, the vast majority of these  
11 that I have placed have been for a perceived situation with  
12 the disk. You know, the eternal question is when you get in  
13 that joint, what are you going to do with this disk? There  
14 are people today that will sit there and tell you that you  
15 can fix a hole in a disk, and orthopedic surgeons who will  
16 tell you that you can't do that because there is no  
17 vascularity. But right now we have well-known people fixing  
18 holes in disks. We have people that reposition disks, and  
19 there are people that still do it and say that they get good  
20 results but we know from the experience in the '70s that it  
21 didn't appear to work across the board.

22 So, to answer your question, when I get in that  
23 joint I am usually expecting to find a significant disk  
24 problem and the diskectomy or meniscectomy, taking that disk  
25 out, has worked well in my hands. The question again is do

1 you put something in there; do you not put something in  
2 there? And, the condyle is usually in good shape, and I  
3 have had better experience putting something in there, and  
4 that something is the fossa. If the condyle is in very bad  
5 shape, then possibly you do need a total joint.

6 DR. HEFFEZ: Thank you.

7 DR. BILLINGSLEY: Dr. Mike Billingsley, Colorado  
8 Springs. In terms of the numbers that you asked about, in  
9 our series of 80 implants, only 5 of those have required the  
10 total joint, and they were not generally related to disk  
11 disease; they were related to rheumatoid arthritic problems,  
12 sequelae of trauma and tumors in 2 cases.

13 DR. RYAN: Doran Ryan. I think we do total joints  
14 only as a last resort. So, we don't want to replace the  
15 condyle if we don't have to. I think in the case of  
16 ankylosis or severe rheumatoid arthritis a total joint is  
17 indicated but, short of that, I think we need to try to do  
18 something other than replacing the total joint itself.

19 DR. HEWLETT: I am Edmond Hewlett. I have a  
20 question for Dr. Billingsley. Dr. Billingsley, you  
21 indicated that in the 80 or so fossa-eminence implants that  
22 you placed you have observed some cases of condylar  
23 remodeling without condylar degradation or deterioration. I  
24 believe that is what you indicated. I am curious what  
25 criteria you are using to distinguish one instance from the

1 other, and also what is the longest time span that you have  
2 had to observe these cases?

3 DR. BILLINGSLEY: Dr. Mike Billingsley, Colorado  
4 Springs. The longest time span is nine years in our  
5 practice. Most of these joints we don't have to reopen. We  
6 have only reopened two or three and, at that point where the  
7 fossa has been in place for, I think, at least two years  
8 in each case we went back in. When we first started doing  
9 these fossa-eminence prostheses there was some controversy  
10 about whether or not to leave a healthy appearing disk in  
11 place. In a couple of places we left the disk in place with  
12 the fossa above it in the sphere joint compartment and we  
13 end up having to go back because of decreased range of  
14 motion in these patients and removing the disk. The  
15 patients subsequently did fine. The observation of the  
16 condyle at that point was that it was smooth. It had some  
17 eburnation with remodeling surface changes, but no cortical  
18 collapse; no sub-condylar necrosis.

19 I think it is very important in these cases to  
20 identify whether there is any evidence of avascular necrosis  
21 in the head of the condyle at the time that you make the  
22 decision to do this. If you have evidence on MRI or other  
23 means that there is avascular necrosis, you are probably  
24 looking for trouble and you may eventually have to replace  
25 the condyle at that point. But we have not generally seen

1 anything like that in the use of these fossas.

2 DR. BERTRAND: Dr. Billingsley, I am Peter  
3 Bertrand and I have another question for you, Dr.  
4 Billingsley. When you are screening patients for a surgical  
5 procedure, does the role of an SSSRI have any impact on your  
6 decision tree in deciding to do surgery, and how do you  
7 assess whether parafunction is still existing in that  
8 patient?

9 DR. BILLINGSLEY: We try to treat our patients  
10 with a team approach. We think it is wrong for patients to  
11 be shuttled from non-surgical care to surgical care and then  
12 not followed up. So, we insist on good control of  
13 parafunctional habits under the care of a non-surgical  
14 practitioner -- good splint therapy, physical therapy,  
15 management of the medications by a physiatrist, a physical  
16 medicine specialist. We try to sole-source the medication.  
17 All of those things are part of our team approach --  
18 psychological evaluation and management if necessary.

19 So, if I understand your question, we think it is  
20 extremely important to manage the occlusion in these  
21 patients. In terms of parafunctional habits, we think that  
22 it is very difficult to control in some cases. We think  
23 most of the trauma to the disk apparatus and the condyle are  
24 probably related to this phenomenon than any other factor.

25 DR. BERTRAND: So, the decision tree is based on

1 the collateral providers that you work with and whether the  
2 parafunction is judged to be under control or not.

3 DR. BILLINGSLEY: And a sufficiently painful  
4 dysfunction and a positive clinical and imaging assessment.

5 DR. BERTRAND: And, do you have any data on the  
6 percentage of your patients that may be taking a selective  
7 serotonin reuptake inhibitor while they are having symptoms?

8 DR. BILLINGSLEY: It is very small. That is not  
9 used very much in our community. The physical medicine  
10 doctors do not use tricyclics to any great extent. I can  
11 recall three or four patients.

12 DR. BERTRAND: Thank you.

13 DR. HEFFEZ: Any further questions from the panel?

14 DR. BURTON: This can go to any of the surgeons.  
15 I would like to know what percentage of your patients come  
16 back on follow-up. There seems to be a very strong question  
17 about the number of people who have long-term follow-up and  
18 why they are lost to follow-up, and how long after surgery  
19 is their care covered under, let's say, a global fee or do  
20 they pay for follow-up, and are we losing a large number of  
21 patients, particularly the dissatisfied patients, because  
22 they have to pay for follow-up care? Not asking about their  
23 financial policies, but for non-study related patients, what  
24 are their financial costs?

25 DR. BILLINGSLEY: Dr. Billingsley again. This is

1 a problem with all of these patients. It depends on the  
2 state that you are practicing in. For example, last time I  
3 checked there were about 19 states that have a right to  
4 treatment law or regulation within the state, and those that  
5 don't are poorly covered by insurance, for the most part, in  
6 my experience. At least in my state that is the case. This  
7 joint seems to be excluded from the realm of right to  
8 treatment in comparison to other joints in the body. We  
9 think that is a horrible disservice to the patients.

10 In terms of losing patients to follow-up, it is  
11 difficult to follow these patients. We live in a mobile  
12 society. I spent twenty years in the military and I moved  
13 thirteen times, and I don't think that is so unusual  
14 anymore. We have patients, I would say, in our community  
15 that move -- I would say the mean is probably every five  
16 years. In our area we have a high tech base --

17 DR. BURTON: I am sorry, my real question revolves  
18 around the fact are those patients, let's say, three months,  
19 six months a year after surgery -- do they have fees for  
20 postoperative visits in your practice?

21 DR. BILLINGSLEY: My group has never charged for  
22 follow-up evaluation.

23 DR. BURTON: So, if a patient came one or two  
24 years later, or three years later, they would not then again  
25 be charged an examination fee. Obviously, there might be

1 radiographs and things like that which is a separate issue,  
2 but I am talking about a professional fee for follow-up.

3 DR. BILLINGSLEY: We have not charged that in our  
4 practice. We want to see these patients and we try not to  
5 discourage them.

6 DR. BURTON: Thank you.

7 DR. RYAN: Dr. Ryan again. Dr. Burton, most  
8 insurance companies have a global fee which covers ninety  
9 days post surgery. So, those patients are seen for free  
10 during that ninety-day period. I think all oral surgeons  
11 try to get their patients back. That is extremely difficult  
12 to do. I think most oral surgeons do charge a fee for  
13 follow-up evaluation. It would be foolish not to. I mean,  
14 that is how we make a living. Certainly, I am sure we make  
15 exceptions for patients who don't have insurance, and try to  
16 follow those patients, but I still believe that there is a  
17 high percentage of patients that are not followed long-term.  
18 We saw that in the Proplast Teflon when we went back to see  
19 what happened to those patients. There are still patients  
20 out there that haven't been contacted. So, we know these  
21 patients aren't followed that well, and that is certainly a  
22 concern and it is hard to put together a controlled study of  
23 patients because the follow-up is very difficult to do,  
24 again, because of the mobility already mentioned and the  
25 fact that cost does get in the way.

1 DR. HEFFEZ: Dr. Bertrand?

2 DR. BERTRAND: I have a question for Terrie  
3 Cowley, please.

4 MS. COWLEY: Yes?

5 DR. HEFFEZ: State your name, please.

6 MS. COWLEY: Terrie Cowley.

7 DR. BERTRAND: You mentioned that since the last  
8 panel meeting 34 patients with implants have come to your  
9 awareness with the TMJ Association. Do you have any way of  
10 verifying what type of implants those patients had received,  
11 and which company produced those implants?

12 MS. COWLEY: These were all implants produced by  
13 Christensen, TMJ Implants, Inc.

14 DR. BERTRAND: And how was that verified?

15 MS. COWLEY: We can't verify. We cannot have a  
16 registry that should be in existence for TMJ Implant  
17 patients. What we have is almost a complaint system. A  
18 patient calls us, a patient e-mails us, a patient writes to  
19 us and tells us, I have this device, or I have a device made  
20 by this company, or I have a titanium device. And, in a  
21 conversation with the patient or in correspondence with try  
22 to find out more specifics about what they have. For the  
23 most part, we do have accurate information -- I had a fossa;  
24 I had an all-metal total joint -- you know, whatever. We  
25 have those broad statistics, not scientifically validated.

1 Some people send us their x-rays. Some people send us their  
2 medical records, probably just trying to have us help them  
3 find out what they have. But if you are asking right now  
4 for a breakdown, I don't have right now how many of the 34  
5 were fossas. I believe I can have that by this afternoon  
6 for you.

7 DR. BERTRAND: If your group can identify the oral  
8 surgeon that placed the prosthesis and it happens to be  
9 associated with one company or another company, do the  
10 companies or the registries freely communicate with you or  
11 is there a problem with that type of communication?

12 MS. COWLEY: The companies do not freely  
13 communicate with us unless there is some benefit to that for  
14 them. We have a problem. We have TMJ Implants, Inc. out  
15 there; we have TMJ Concepts. TMJ Concepts happens to answer  
16 any phone call from any patient who calls them. We know  
17 that. The patients tell us, and they tell us what the  
18 company is telling them about their device. They shuffle  
19 them over to their web site. They appear to be a company  
20 that communicates with the patients. Obviously, in the last  
21 year TMJ Implants, Inc. has not had any communication with  
22 patients. The people who have asked us how to communicate  
23 with the company; who is the company; where are they  
24 located, and on an on -- we simply give them their address  
25 and phone numbers. We obviously frequently hear, and I

1 brought this out at the last Dental Product Panel meeting,  
2 these patients are always told you have to talk to your  
3 surgeon. They do not communicate with the patient who has  
4 had any type of complaint or even question. So, this is  
5 what I am hearing. Is there a database registry of patients  
6 in the companies? We sure hope so because obviously we, the  
7 patients, are going to have to take control of a situation  
8 where there is an incredible discrepancy between what the  
9 patients are living, what they are telling us and each  
10 other, what the doctors are telling the patients, what the  
11 manufacturers are telling the surgeons and the patients.  
12 So, until and unless we are able to collaborate in some  
13 manner with an implant registry that is mandatory, not  
14 voluntary, that has an independent monitor, this database  
15 into which patient, direct patient information is given --  
16 unless we have that we can't trust anyone.

17 DR. BERTRAND: Thank you.

18 DR. HEFFEZ: Any other questions from the panel?  
19 As chair, I have one question to Dr. Ryan. Many of your  
20 comments addressed metal-on-metal. Could you tell us if you  
21 feel there are any indications for the fossa-eminence  
22 alloplastic replacement.

23 DR. RYAN: I have not used the fossa-eminence  
24 implant, mainly because I think there are other procedures  
25 that can be accomplished, short of putting an alloplast in

1 the joint, for the indications they have indicated for that  
2 particular product. So, I have really not used that implant  
3 myself. I think my concern with it is that you are putting  
4 bone against metal. You are rubbing bone against metal and  
5 that, to me, doesn't make a whole lot of sense. It seems to  
6 me that bone is going to wear down from a biological  
7 standpoint. I just think there are other procedures that  
8 can be used. Again, there is no other joint in the body  
9 that does hemiarthroplasties. That has pretty well failed  
10 in the past. Does that answer your question?

11 DR. HEFFEZ: Yes, thank you. Any further  
12 questions from the panel? At this time, we will take a 15-  
13 minute break. We will reconvene at 10:45 exactly.

14 [Brief recess]

15 DR. HEFFEZ: We will proceed to the next part of  
16 this meeting, which is the industry presentation. I would  
17 like to announce for you that the sponsor we are going to be  
18 hearing from is TMJ Implants, Inc. Today we are reviewing  
19 premarket approval application specifically for the TMJ  
20 Fossa-Eminence Prosthesis. Without further ado, I again  
21 need you to state your name for the record.

22 **Industry Presentation**

23 **TMJ Fossa-Eminence Prosthesis**

24 MR. COLE: Than you, Mr. Chairman. My name is  
25 Michael Cole. I am an advisor to the company, but this

1 morning I am functioning in the role of moderator for the  
2 company presentation.

3 [Slide]

4 We have a lot of information to present in a  
5 relatively short period of time. So, without any further  
6 preamble, I would like to introduce to you Dr. Robert  
7 Christensen, the president of the company and the developer  
8 of the implant, who will describe the clinical situation he  
9 was confronted with in the early '60s that led him to the  
10 development of the device, and where he believes it fits in  
11 the regimen of treatment for the GMD patient.

12 DR. HEFFEZ: While we wait for him to come to the  
13 podium I will remind you, you have one hour for  
14 presentation. We are starting at 10:45.

15 DR. CHRISTENSEN: I am Dr. Bob Christensen. I am  
16 glad to be here again. I do have a financial interest in  
17 the company, in case anybody thought I didn't.

18 [Slide]

19 Back in the 1950s I had done surgery on this  
20 joint, on the patients and so forth, and had done a great  
21 deal of surgery on fractures and what-have-you but also had  
22 done things such as meniscectomies and so forth for pain in  
23 this joint and some of the other things that some of the  
24 older gentlemen remember. Dr. Laskin, back here, I know he  
25 remembers it. But we did things that at the time seemed

1 right, and they did do some good.

2 But I began to realize that something was needed  
3 to be placed in that joint. It was not any big study of  
4 mine to get there. I was driving down the road and it  
5 really hit me how I could do this, and that was the genesis  
6 of that in the 1960's, forty years ago.

7 A few months after that I operated on the first  
8 patient. This patient had had the meniscectomy and  
9 condylectomy done by another surgeon in the State of  
10 California, and she had a fibro-osseous fusion of the  
11 condylar neck to the articular eminence. I knew I needed to  
12 put something in there. So, I developed and put in the  
13 fossa-eminence implant on that patient.

14 There was a lot of discussion at that time on was  
15 this a viable procedure or not, and one of the things that  
16 really helped me at that time -- the two doctors that did  
17 the hip surgery, Dr. Smith Peterson and Otto Alfrank in Dr.  
18 Willie Stephens hospital, up there in Massachusetts, wrote a  
19 letter in '64 and said this is a real contribution to the  
20 surgery of a degenerative joint problem, and he knew what I  
21 had done. He had seen my first article in the American  
22 Journal of Orthopedics in 1963.

23 I began to realize that this thing was very useful  
24 in replacing that disk. So, that is how I did it and I  
25 began to do it, and I almost never had to reoperate on these

1 patients. I had an extremely good fortune over many, many  
2 years with it. We keep much better tracking today than I  
3 did then, but I can tell you that I look back at that first  
4 surgery about twenty-five years later and, instead of losing  
5 bone off that condylar neck, she began to grow bone back  
6 around it, and I went ahead and took that ankylosis out and  
7 left the original plate in that was there twenty-five years  
8 before and put a condyle below it. Forty years later she is  
9 still functioning. We have many patients just like that.

10 And, for somebody to stand up here and say they  
11 don't know about hemiarthroplasty in a joint -- they just  
12 don't know what is going on because Otto Alfrank and Smith  
13 Peterson had done it in the hip; many of them have been done  
14 since that time and certainly the shoulder joint is one that  
15 is operated quite routinely that way. So, without saying  
16 more about it, I think our presentation will answer a lot of  
17 questions for you and I will step back for Mike Cole.

18 MR. COLE: Thank you, Dr. Christensen. The  
19 question has been raised is unnecessary surgery being  
20 performed? Has the applicant sufficiently identified a  
21 patient population for whom the use of this device is  
22 suitable? We will attempt to address that question in a  
23 number of presentations this morning, and we believe that in  
24 large measure the standard of care is a very important  
25 consideration here, as is the diagnosis of internal

1 derangement. To address those subjects, I would like to  
2 present to you Dr. Rick Alexander, from St. Luke's Roosevelt  
3 New York, New York. Dr. Alexander is a recognized authority  
4 on the standard of care, having lectured, written and  
5 testified on the subject numerous times as it relates  
6 specifically to the oral maxillofacial surgery. Dr.  
7 Alexander?

8 DR. ALEXANDER: Thank you, Mr. Cole and panel  
9 members. I do not have any financial interest in TMJ  
10 Implants, Inc., and the expenses for my trip here -- the  
11 payment of those was assisted by TMJ Implants, Inc.

12 [Slide]

13 I am the director of the Division of Oral -- let  
14 me say something in the beginning, we are going to use this  
15 term, OMS, instead of oral and maxillofacial surgery. So,  
16 when you see that term, that is what we are talking about.  
17 I am the director of the Division of Oral and Maxillofacial  
18 surgery at St. Luke's Roosevelt Hospital Center, in New  
19 York. St. Luke's is a major New York City teaching hospital  
20 and a level I trauma center. I am here primarily out of my  
21 interest in patient care and appropriate residency training  
22 for oral and maxillofacial surgery residents.

23 [Slide]

24 CDHR has raised the question of whether there is  
25 unnecessary surgery being routinely performed for TMJ

1 disorders. It has been estimated there are some ten million  
2 people out there that at some point in their life have some  
3 kind of temporomandibular disorder. Approximately five  
4 percent of these patients have potentially a surgical  
5 problem. If you look at that number and look at how many  
6 people have a problem out there, I can assure you that  
7 nowhere near five percent of ten million are getting  
8 operated on.

9           The other issue I think is if you look at the ten-  
10 year closed-claim liability losses by description of  
11 procedure for TMJ surgery, AAOMS national insurance company,  
12 which is the largest insurer of oral and maxillofacial  
13 surgeons -- and, again, you are going to see this term,  
14 AAOMS and that stands for American Association of Oral and  
15 Maxillofacial Surgeons. This is the largest insurer of  
16 people in our specialty. Their ten-year closed-claim  
17 liability loss by type of procedure is three percent for TMJ  
18 surgery. It is higher than that for almost every other  
19 thing that we do. It is higher, for instance, for  
20 infections; it is higher for fractures; it is higher for  
21 dental-facial deformities. It is three times higher for  
22 those things, between eight and ten percent. Of the major  
23 surgical procedures that we perform, this has the lowest  
24 liability loss and I submit to you that if this surgery was  
25 being performed unnecessarily and poorly those statistics

1 would be much higher.

2 [Slide]

3 The other question that the CDHR has raised is  
4 whether internal derangement is a specific diagnosis.  
5 Internal derangement -- I think I can show you that it is a  
6 very specific diagnosis. First of all, internal derangement  
7 has to do with disorders of the disk or meniscus in that  
8 joint. Now, the disk or meniscus is an anatomic structure  
9 made up of soft tissue that is interposed between the head  
10 of the joint and the fossa or the socket. This disk  
11 derangement has been classified and staged by a number of  
12 authors -- Wilkes, Bronstein and Merrill McCain. Wilkes is  
13 probably the best known, and his classification divides the  
14 displacement and/or damage to the disk into five categories,  
15 early, early-intermediate, intermediate, intermediate-late  
16 and late. And, that is very specific in my mind. The other  
17 authors have done the same thing but as related to  
18 arthroscopy.

19 In addition to that, the 1995 AAOMS parameters of  
20 care list internal derangement as a specific diagnosis. It  
21 is interesting to note that the 1995 NIH Technology  
22 Assessment statement recognized this publication as being an  
23 authority at this time.

24 [Slide]

25 The 1995 AAOMS parameters of care, what it

1 basically does is it presents accepted patient management  
2 strategies, in this case for TMJ surgery. It presents them  
3 for other types of surgery we do. Now, the standard of care  
4 is defined as what a reasonable and prudent oral  
5 maxillofacial surgeon would do under the conditions.

6 I submit to you that a reasonable and prudent oral  
7 maxillofacial surgeon is going to follow these accepted  
8 standards. I am familiar with a significant number of  
9 people in the United States that do a significant amount of  
10 joint surgery. I am familiar with their practices, and I  
11 can assure you that complying with the standard of care and  
12 these strategies is the norm.

13 [Slide]

14 If you are going to follow the standard of care,  
15 the first thing you have to do is make a proper diagnosis.  
16 Now, this is really important because temporomandibular  
17 disorders are of two types. The first type is not a  
18 surgical problem and it is not joint disease. This is just  
19 something where the patient can have pain that gets referred  
20 to the joint. They may have dysfunction of the joint, but  
21 it is not coming from the joint.

22 In contrast, we have another group of patients  
23 that have TM disorders which are actual joint disease. This  
24 is just like the hip, the knee, all other joints. These  
25 patients are potential surgical problems. You have to

1 separate these patients out if you are going to perform  
2 surgery and do it appropriately.

3 [Slide]

4 The TM disorders that are not surgical or not  
5 joint disease -- the most common of these is muscle spasm.  
6 Now, muscle spasm can refer pain to the joint. It can also  
7 keep the patient from opening wide. So, you can get  
8 dysfunction and you can get limited opening and pain from  
9 muscle spasm. That is not joint disease, and those patients  
10 aren't going to be surgical candidates.

11 Now, these are actual joint diseases, and despite  
12 what anybody will tell you, these are the same diseases that  
13 occur in every other joint in the body. It is nothing, you  
14 know, magic. Now, ankylosis, infection, general anomalies,  
15 tumors and trauma -- except for those top two, I submit to  
16 you that those are unquestionably surgical problems.  
17 Wearing a splint isn't going to help any of those people.

18 Internal derangement or disk disorders and  
19 arthritis in the early stages -- and, when we talk about  
20 arthritis, there are all kinds of types of arthritis; the  
21 type that affects this joint most often is osteoarthritis or  
22 degenerative joint disease, however you like to call it. In  
23 any event, these two conditions will sometimes, depending on  
24 their state, respond to non-surgical measures early on. As  
25 the disease process progresses, they are pretty refractory

1 to those non-surgical treatments.

2 [Slide]

3 The way we decide whether we have a non-surgical  
4 versus a surgical disorder is through a comprehensive  
5 physical examination, and I think it goes without saying  
6 that if you think the patient has a neurological problem,  
7 they get a neurology consult. If you think they have  
8 diabetes, they get an internal medicine consult. That is  
9 how we are trained to work patients up, just like everybody  
10 else in medicine or dentistry. So, that goes without  
11 saying. If you think the patient has a psychological  
12 problem, they are going to get a psychiatric and psychologic  
13 consult.

14 The other thing we use is imaging. The gold  
15 standard for imaging right now is the MRI because with these  
16 other imaging methods you can't see soft tissue and the MRI  
17 shows soft tissue. Internal derangement is a disk or  
18 meniscus problem and it is soft tissue. And, before the  
19 advent of MRIs, I will agree with anybody who said that we  
20 don't understand what is going on with this joint. I will  
21 tell you that with MRIs in combination with arthroscopy  
22 where we can look into the joint, we do know what is going  
23 on in this joint.

24 [Slide]

25 Again, these disorders right here, except for the

1 top two, are without question surgical, and internal  
2 derangement and arthritis can become surgical problems. For  
3 instance, internal derangement -- we have heard a lot this  
4 morning about that, and the Wilkes classification, as I  
5 pointed out earlier, is a classification that ranges from a  
6 very limited displaced and damaged disk to one that is very  
7 displaced and damaged. And, patients that fall into the  
8 category of III through V frequently end up being surgical  
9 problems. Patients with long-term internal derangement  
10 frequently develop degenerative joint disease, and  
11 frequently become a surgical problem.

12 [Slide]

13 Now, as far as non-surgical treatments go, there  
14 are tons of them out there. The ones that you are probably  
15 going to see the most attention paid to are splints,  
16 medications, physical therapy, TENS. Obviously diets and a  
17 number of other things play a role.

18 The splint thing has received a huge amount of  
19 attention. I will address that again in a second.  
20 Medications -- the things that are used most commonly are  
21 anti-inflammatories. Physical therapy can either be  
22 performed by the patient or they can be referred to a  
23 physical therapist. Then, transcutaneous neurostimulation,  
24 it is questionable whether that is valuable or not but there  
25 are people that use it and it certainly doesn't do any

1 damage.

2 [Slide]

3 Now, splints receive all kinds of attention. What  
4 I classically see is a patient that calls me up and says,  
5 "oh, I've got TMJ and I'm wearing a splint." Well, TMJ is  
6 not a disease. So, the first thing we have to find out is  
7 what is wrong with them. I already showed you how we  
8 determine that.

9 So, a lot of these patients get a splint, and I  
10 think what you need to understand about a splint is that the  
11 only thing it does is unload the joint. Okay? These  
12 disease processes, internal derangement and arthritis are  
13 caused by overloading of the joint. Somebody on the panel  
14 mentioned that earlier, parafunctional habits, chewing on,  
15 you know, bobby pins, fingernails, gritting your teeth,  
16 those are all things that overload the joint. A splint  
17 unloads that joint, but I will tell you what it doesn't do.  
18 If you have an anterior displaced disk and it is all  
19 plastered down from adhesions, wearing a splint is not going  
20 to recapture that disk. Wearing a splint is not going to  
21 make a hole in a disk repair itself.

22 So, there is a role for splints to play but I  
23 don't think wearing a splint indefinitely serves any useful  
24 purpose. So, then the question comes how long should non-  
25 invasive or conservative therapy go on? Well, I think it is

1 reasonable to say that if conservative therapy, splints,  
2 medications etc. haven't decreased the pain, increased the  
3 opening and gotten rid of noises in one to six months, they  
4 probably aren't going to in one to six years. So, this is  
5 an individual judgment that has to be made between the  
6 patient and the surgeon. I think most people tend to be in  
7 this range, one to six months. Some tend to be closer to  
8 one or closer to six. I tend to be in the middle.

9 [Slide]

10 All right, when do you operate on these patients?

11 Well, we are back to the AAOMS parameters of care. The  
12 AAOMS parameters of care say that surgical intervention for  
13 internal derangement or degenerative joint disease is  
14 indicated only when non-surgical therapy has been  
15 ineffective, and when pain and/or dysfunction is moderate to  
16 severe in nature.

17 I will submit to you that Wilkes Class III through  
18 V fit most of the time in this category, pain and/or  
19 dysfunction which is moderate to severe in nature. Surgery  
20 is not indicated for asymptomatic patients. Pretreatment  
21 therapeutic goals are determined individually for each  
22 patient. I just mentioned that the patient and the doctor  
23 have to decide how long they are going to proceed with non-  
24 surgical treatment if the patient can't open their mouth,  
25 has pain and noises.

1 [Slide]

2 Back to the parameters of care again. Parameters  
3 of care list a number of acceptable procedures for the  
4 treatment of internal derangement or degenerative joint  
5 disease, the first of which is arthrocentesis, which is just  
6 washing out the joint. Patients that have an inflammatory  
7 process in the joint are going to have a bunch of byproducts  
8 of inflammation and this, not uncommonly, gets rid of those  
9 and helps the patient for some period of time.

10 Arthroscopy, you do the same thing but you can  
11 actually look into the joint. It is a scope with a camera  
12 on the end. We look up on a monitor or television screen  
13 and we can actually see what is going on. So, the argument  
14 that we don't know what is going on in this joint doesn't  
15 fly. Between MRIs and arthroscopy, we do know what is going  
16 on.

17 Another treatment that they have listed as  
18 acceptably is arthroplasty with or without grafts. That can  
19 include meniscectomy or removal of the disk. They also list  
20 grafts as acceptable, autogenous or alloplastic. Autogenous  
21 are ones that come from the body and alloplastic are not. I  
22 submit to you that TMJ Implants, Inc. is an alloplastic  
23 graft.

24 We heard a little earlier from one of the speakers  
25 that hemiarthroplasty is not performed in any other joint.

1 In St. Luke's Roosevelt Hospital Center at least two cases a  
2 week of hemiarthroplasty of the hip are performed by  
3 orthopedic surgeons, and they place metal-on-bone with that  
4 procedure.

5 [Slide]

6 This is really important because I don't think  
7 anybody who hasn't seen and worked with these patients can  
8 make any kind of a judgment, and you have to see the actual  
9 patient. Again, the parameters of care say that the  
10 ultimate judgment regarding the appropriateness of any  
11 specific procedure must be made by the individual surgeons  
12 in light of the circumstances presented by each patient.

13 Now, I want you to understand one other thing if  
14 you don't get anything else out of this. TMJ surgery or  
15 joint surgery of the hip or the knee, or any other joint, is  
16 not a perfect procedure. If you have a problem with your  
17 knee and you go to the orthopedic surgeon and it hurts, and  
18 you can't move it and you have noise in it, he or she is not  
19 going to tell you that they are going to operate on that  
20 joint and it is going to be like before all this happened.  
21 It is the same with TMJ surgery. The goal is to decrease  
22 pain, increase range of motion, get rid of noises and, to  
23 that extent, if you look at statistics we are as good, or  
24 better, at doing that than the people who do hips, knees,  
25 shoulders, whatever. I thank you for your time.

1 MR. COLE: Thank you, Dr. Alexander. We would now  
2 like to turn to two very experienced surgeons, the first,  
3 Dr. Anthony Urbanek in private practice, in Nashville,  
4 Tennessee. Dr. Urbanek used the Fossa-Eminence Prosthesis  
5 when it was available as a pre-enactment device. He also  
6 participates in the ongoing prospective clinical  
7 investigation. We have asked Dr. Urbanek to describe to you  
8 how he applies these standards of care or how does he pick  
9 his patients, what result has he seen with the device, and  
10 describe to you any untoward events that he has experienced,  
11 particularly any effect on the natural condyle. Dr.  
12 Urbanek?

13 DR. URBANEK: Thank you very much, Mr. Cole.

14 [Slide]

15 My name is Tony Urbanek. I am from Nashville,  
16 Tennessee. I am an oral and maxillofacial surgeon, and I  
17 have no financial connection with TMJ Implants, Inc. or any  
18 other implant company. TMJ Implants, Inc. did support my  
19 expenses for this trip from Nashville to Washington today.

20 [Slide]

21 First, I would like to go through briefly what I  
22 believe are my credentials to speak before this very august  
23 panel, and very well-experienced people here this morning.  
24 I have a dental degree which I got from Indiana; medical  
25 degree I received from Vanderbilt; went through my surgical

1 training at Vanderbilt, and entered a Ph.D. program toward a  
2 Ph.D. in anatomy. At that point in time, I applied for and  
3 was given a grant to the NIH for study of intrauterine field  
4 surgery using a laser. This was in 1976 before almost  
5 anybody knew what a laser was. I bring that to your  
6 attention not to pat myself on the back but just to say that  
7 I am a scientist; I am not just an oral and maxillofacial  
8 surgeon who does surgery every day. But that is what I am  
9 very proud of doing, and that is what I do.

10 I have a lot of experience and, in 1981, after  
11 doing all of that training I decided, for various reasons,  
12 that I was going to come out into private practice and I  
13 wasn't going to be an academician. At that point in time,  
14 in 1981, I was confronted and needed to see many patients  
15 with temporomandibular joint complaints. Over a period of  
16 the next ten years, between 1981 and 1991, I tried and  
17 utilized all modalities of treatment that were available for  
18 these patients, conservative, non-surgical, surgical -- all  
19 varieties. If it was written about, I tried it.

20 What I found out during many, many, hundreds of  
21 patient experiences, many, many surgeries is that without  
22 exception, especially for the surgical patients, I did  
23 meniscectomies without reconstruction. I did meniscus  
24 reconstruction. I used all kinds of alloplasts and other  
25 types of implants, and I found that consistently within six

1 months or a year each and every one of those patients would  
2 return to my office and tell me that they had the symptoms  
3 that they originally came in with and the same complaints.

4 This was very disconcerting. It was very  
5 frustrating. As I believe was mentioned earlier, I was at  
6 the point where I had decided I just didn't want any more  
7 part of temporomandibular joint surgery. If there is anyone  
8 in the room who is concerned and worried about the use of  
9 alloplasts and the use of implants in temporomandibular  
10 joint surgery, it is me. Between 1983 and 1987 I placed 80  
11 Proplast Teflon implants. I have now taken out 78 of them,  
12 and the two that are in, in the same patient, are in a good  
13 friend of mine and I can't convince her to get them out. I  
14 see her frequently and I will take them off for nothing.  
15 But I have experienced that problem. I have had to confront  
16 it and, believe me, I would be the last person to engage in  
17 any kind of activity that I did not believe was successful  
18 for my patients.

19 With my comments about my technical credentials, I  
20 would like to say that I am not representing myself at this  
21 point in time as a scientist. My experience -- 35 percent  
22 of my experience, 35 percent of my patients are represented  
23 in the study that TMJ Implant will present to you very  
24 briefly, and I let those facts speak for themselves. I  
25 don't speak to you as a clinical. But I speak to you today

1 because I represent my patients. I represent those 351  
2 joints and 217 patients that I have done, and I represent  
3 these 14 patients, now 16 because there are two added to  
4 this list as of Wednesday, my last day in the office before  
5 I came here -- I represent these 16 patients who were unable  
6 to get the partial joint prosthesis for the past 6 months  
7 because it has been taken off the market by the FDA.

8 I am the one who has to explain to these patients  
9 why it is taken off the market. I had a conversation about  
10 eight months ago, maybe nine months, with Dr. Runner who  
11 asked my opinion -- this was on the telephone -- asked my  
12 opinion of my experience with this implant system in  
13 patients. I went through in great detail what I thought of  
14 it; what my experience was; my indications for putting it  
15 in; how I handle my patients; and exactly what I thought of  
16 it. I also asked her, I said, you know, this is a very good  
17 prosthesis. It has been on the market for 35 years. I have  
18 not had any significant problem with it. I would like to  
19 know why it is being reviewed again. I mean, I understood  
20 all of the problems in the review process and I wanted to  
21 know exactly why it has taken so long to get this thing  
22 approved.

23 I didn't get any direct answers, but what Dr.  
24 Runner did ask me is, she said, Dr. Urbanek, what would you  
25 think if, in the next couple of months, we took this

1 prosthesis off the market for a period of time while we  
2 reviewed it? Because, at that point in time, it was still  
3 on the market. And, I said, Dr. Runner, this is not a  
4 question you should ask of me. This is a question you  
5 should ask of my patients. I can tell you what my patients  
6 will say. My patients will say that they are having extreme  
7 pain and that they want relief.

8           Now, this lists 16 patients. It is available to  
9 you if you care to see it. I agree with everything that Dr.  
10 Alexander presented to you this morning as to how I select  
11 the patients, my criteria, the use of the American  
12 Association of Oral and Maxillofacial Surgeons criteria, but  
13 it is the patients I want to speak for.

14           Over the period of the last ten years, beginning  
15 in 1991, I began using the Christensen prosthesis very  
16 carefully at first -- very carefully at first. I did a  
17 patient. The patient came back in six months, doing well.  
18 The patient came back in a year, doing well. Well, I got a  
19 little bolder. I went and did another patient. Well, over  
20 the next ten-year period of time I found that with the  
21 Christensen prosthesis, without almost any exceptions, after  
22 six months, after a year, after two years and longer the  
23 patients would come back and respond that they are doing  
24 well. Their function was good. They could chew what they  
25 want. They were opening well and, most importantly, they

1 were out of pain. This is what I am confronted with daily,  
2 to deal with patients with pain, not for weeks or months but  
3 patients who have had five years, ten years, fifteen years,  
4 twenty years of constant, consistent pain and I am the last  
5 guy that they come to. They have already been to dentists.  
6 They have already been to neurosurgeons. They have been  
7 called crazy. They have been to psychiatrists. They have  
8 been on drugs. They have had surgery done on their sinuses.  
9 They have had surgery done on their nose. They have had all  
10 kinds of other surgeries and finally somebody, you know,  
11 pushes on their joint, the joint is tender and they say  
12 maybe you ought to go and see Dr. Urbanek.

13 I have a referral practice. My results are  
14 somewhat skewed because I don't see many patients who have  
15 Wilkes class I and class II temporomandibular joint  
16 problems. I see patients who have been around the block  
17 lots and lots, and they come from all over the State of  
18 Tennessee and beyond. The reason that I have accumulated  
19 this many patients is because it is successful. I will  
20 present with all sincerity to this panel do you think that I  
21 would be doing a procedure this many times and having  
22 patients coming back to me, saying, "I have pain; it doesn't  
23 work. I'm in the same shape I was in before."

24 Since 1991, I gradually began getting bolder and  
25 bolder using the prosthesis more and more. It is my

1 definite experience that it is a very, very successful  
2 prosthesis in the way that it handles patients' pain and in  
3 ability to open. I have not seen any patient go to fibrosis  
4 after the use of the prosthesis. I have been into  
5 approximately five joints two years or so, or more, after  
6 the prosthesis was placed, because of trauma. I have had  
7 several patients who have had accidents after the prosthesis  
8 was placed. The prosthesis was displaced and I had to go in  
9 and replace it, just literally take the loose one out, put  
10 the new one in and then they went along their way. But at  
11 that point in time I was able to see the condylar head. I  
12 was able to visualize the condyle when I went in. Visually,  
13 I have never seen any evidence of condylar degeneration of  
14 the mandible on a prosthesis that has been in anywhere  
15 between a year and five years.

16 [Slide]

17 The patients' response goes back in my practice to  
18 1991. I have a twenty-year experience, and utilized all  
19 types of treatment. My practice is a referral type of  
20 practice. I have used the indications from AAOMS. And,  
21 over that twenty-year period, it is my common, consistent  
22 action that after I do a maxillofacial case of any kind,  
23 after a year or so I ask the patient if they want to write a  
24 success story about what I did for them. I have  
25 accumulated, not only on temporomandibular joints but on all

1 kinds of facial surgery many, many success stories. I have  
2 before me, in my hands, ten of those success stories on  
3 patients who had done temporomandibular joint glenoid fossa  
4 implants over the past ten years, with the earliest one in  
5 this pile going back to 1994. If you care to read them, I  
6 have brought copies. I have a hundred more back in the  
7 office, if you would like to see some more.

8 But, I would like to read one, again, on behalf of  
9 my patients because that is who I am speaking for: For the  
10 past twenty years I have suffered with headaches, chronic  
11 neck pain, facial pain, earaches, toothaches, shoulder pain  
12 and clicking of the jaw. As my pain got worse, I began to  
13 mention it to different doctors. They all thought I had  
14 sinus problems. So, after a series of tests, medication and  
15 x-rays proved not to help it and the problem got worse, I  
16 went to an ear, nose and throat specialist. He said that he  
17 thought I had TMJ but he didn't think anything could be  
18 done. Then I checked with my dentist who gave me some jaw  
19 exercises to do which did not make any difference in my pain  
20 either. Then I remembered a friend who said that she had  
21 TMJ. I questioned her about the symptoms and she referred  
22 me to Dr. Urbanek. I had TMJ surgery and have not had one  
23 headache, period. All of the other pain is gone. Needless  
24 to say, I am thrilled and ever so thankful for my relief. I  
25 feel younger and alive again.

1 I have only read one to you but this is  
2 representative of what I am holding in my hand. It is also  
3 representative of the hundred I have in my office. I am not  
4 here to promote TMJ Implant, Inc. I am here as an advocate  
5 for my patients. I have found over the past ten years that  
6 there is a prosthesis that in my hands consistently works to  
7 the betterment of my patients.

8 You know, I take it as an insult that my results  
9 by some have been called anecdotal. You know, I want to  
10 make it clear that all of us -- everyone on the panel,  
11 everyone who is a professional in the room, and myself  
12 included -- our primary interest is in the treatment of  
13 patients. If we get lost in the science, which is important  
14 -- I am a scientist. I am the guy who did the earliest  
15 study on fetal surgery. But if lose point of the fact that  
16 we are treating patients and that is what we are here for,  
17 for their goodwill and to protect, then we are not doing our  
18 job.

19 Now, I also want to state that I have heard from  
20 others who preceded me negative comments. Dr. Ryan had  
21 negative comments. I want to say that he admitted in front  
22 of you he has never done a partial joint Christensen  
23 implant. I present only my experience in retort.

24 So in summary, I would like to ask the panel to  
25 carefully look at our presentation as to the effectiveness

1 and safety of the glenoid fossa Christensen partial insert,  
2 which I think is what our charge is here at this meeting.  
3 In fact, I know that is what our charge is at this meeting -  
4 - the partial prosthesis.

5 I would like you to look at the evidence  
6 presented, the scientific evidence presented. The  
7 scientific evidence that will be presented is very clear-  
8 cut. The scientific evidence are a part of in the study  
9 which I have entered as a participant in Christensen company  
10 backs up the science behind it. But I ask you most  
11 importantly to consider the patients who will benefit by  
12 having it available. When you make your decision at four  
13 o'clock or so, I ask you with all humility to approve or to  
14 make a recommendation, because I understand it is a  
15 recommendation panel, to make your recommendation for  
16 approval and, as human beings, add that we expect it to be  
17 approved. Thank you.

18 MR. COLE: Thank you, Dr. Urbanek. We need to  
19 move along now right to Dr. James Curry, in private practice  
20 in Colorado, who will talk about his selection criteria,  
21 results, and make some comments on the FDA review of a study  
22 that was submitted in the premarket approval application  
23 dealing with wear on the natural condyle. Dr. Curry?

24 DR. CURRY: Yes, I am Dr. James Curry. I have  
25 been doing temporomandibular joint surgery for upwards of

1 about thirty years, and I have had about a twelve-year  
2 experience with the Christensen devices.

3 [Slide]

4 I would just like to state up front that we use a  
5 very similar technique in making a diagnosis and treatment  
6 plan for patients who might be needing a hemiarthroplasty.

7 [Slide]

8 I would like to show you just a study of some  
9 patients that I did prior to the registry that TMJ Implants,  
10 Inc. was required to keep, beginning in 1993. I looked at  
11 patients that I had operated between 1988 and 1992. This  
12 study was subjected to statistical scrutiny and there is a  
13 significant decrease in the pain in this group of patients,  
14 50 in this study.

15 [Slide]

16 We looked at opening in a similar group of  
17 patients, and it has already been commented on that we do  
18 have some problems getting all of these patients back.  
19 These patients were measured with a Therabite measuring  
20 device, and there is a significant increase in the patient's  
21 ability to open in this group of patients.

22 [Slide]

23 This group of patients then was compared with  
24 patients from the TMJ registry and patients from our ongoing  
25 prospective clinical trial. You can look at the numbers of

1 patients in these various studies, but the thing that I want  
2 you to really see is the amazing similarities in the  
3 beginning pain levels, the postoperative pain levels, the  
4 beginning opening levels and the postoperative opening  
5 levels.

6 [Slide]

7 There have been a number of questions raised at  
8 this meeting and at other times about what is the condylar  
9 response to the hemiarthroplasty in this joint, what is the  
10 bone response. We have heard some anecdotal remarks and no  
11 one seems to have any science on this. We follow our  
12 patients clinically and radiographically to make a  
13 determination whether or not the condyle has pathologically  
14 degenerated following our procedures.

15 [Slide]

16 This is an example, and I will show you two or  
17 three cases to typify what I have seen in my clinical  
18 practice and in my study. This is a stage IV internal  
19 derangement patient preoperatively, immediately  
20 postoperatively and 11 years, 9 months postoperatively.  
21 This is pretty typical of the patients that we see, and we  
22 generally follow our patients with Panorex. I don't charge  
23 my patients for coming back and I don't even charge most of  
24 them for their follow-up x-rays.

25 One criticism of the model fossa liner has been

1 that it obscures our ability to look at every detail of the  
2 condyle, but I submit to you that you can't see every detail  
3 of a condyle on a Panorex anyway. In this particular series  
4 you can see very clearly that there is very little, if any,  
5 pathological remodeling anyway.

6 [Slide]

7 Let's look at this slide. This is the opposite  
8 joint in the same patient. I submit to you that this one is  
9 obscured even a little bit more in all three views, but when  
10 we look at the clinical picture of a patient this long after  
11 surgery and their occlusion hasn't changed, and their pain  
12 level is practically nil, and they can eat almost anything  
13 they want and their maximal incisal opening is 42 mm -- you  
14 have to look at both the clinical as well as the  
15 radiographical to follow these patients along.

16 [Slide]

17 This is a stage III internal derangement. This is  
18 immediately postop, in 1989, and this is a 5 year, 1 month  
19 radiograph. There are no real changes between the two, but  
20 you can't see the actual edge of the condyle as the fossa  
21 liner obscures that a bit.

22 [Slide]

23 I decided sometime ago that to try and answer this  
24 question for myself and my patients I would do some CT scans  
25 on some of these patients where the condyle was not as

1 visible as it might be. This is a CT scan of that patient.  
2 This is 10 years, 1 month postop. Clinically she is doing  
3 as well as any patient that I have, and in the sagittal CT  
4 scan you can see a very nice cortical outline and a nice  
5 marrow space, and in the coronal view you also see that the  
6 condyle has not degenerated.

7 [Slide]

8 This is an example of a stage V internal  
9 derangement. This is a multiply operated joint patient.  
10 This is the presurgical Panorex. This is the immediate  
11 postsurgical Panorex -- no, 5 years, 1 month postop. Again,  
12 a little bit of distortion because you can't see through the  
13 metal fossa liner.

14 [Slide]

15 This is the opposite side of this same patient.  
16 Again, you can't see all of the condyle. So, we did a CT  
17 scan on this lady.

18 [Slide]

19 In the CT view you are able to see more of the  
20 condyle. This is the sagittal in three different levels.  
21 This is the coronal view, and there is no pathological  
22 condylar degeneration 9 years, 9 months postop.

23 [Slide]

24 This is the opposite side. This is the sagittal  
25 and the coronal view of the same patient.

1 [Slide]

2 I would like to submit to the panel that this is  
3 an example of a patient, and this is a tomogram of a joint  
4 in 1983. This patient went through standard conventional  
5 treatment for temporomandibular disorders and  
6 temporomandibular joint pain and dysfunction. Over the  
7 course of time, when she got to my office in 1991, there was  
8 absolutely no condyle there. This patient has never had an  
9 alloplast in this joint. This is the opposite joint.

10 What I am trying to explain to you as well is that  
11 you can see these kinds of pathological deteriorations  
12 radiographically even with a metal fossa liner in place.

13 [Slide]

14 You also begin to see clinical evidence of severe  
15 degenerative joint disease with open bite deformities, and  
16 that is the way this lady presented.

17 [Slide]

18 I would like to comment briefly on the idea that  
19 every TMJ patient must go through an exhaustive non-surgical  
20 treatment regimen. I think Dr. Alexander stated this very  
21 clearly. This is a 16-year old girl, fractured condyle,  
22 ankylosis. This patient doesn't need psychological care;  
23 this patient doesn't need splints. This patient needs  
24 surgery, and the surgery that we did -- rather than do a  
25 total joint, or rather than put some kind of a ribgraft in

1 here, we did a hemiarthroplasty. I submit to you that  
2 hemiarthroplasty is much, much better for some patients than  
3 subjecting patients to total joint procedures.

4 [Slide]

5 This is another example of a pathological  
6 condition. You can see the tumor. This is synovial  
7 chondromatosis. This patient needs an operation. So, this  
8 was done.

9 [Slide]

10 In conclusion, surgeons must exercise good medical  
11 judgment in deciding whether to place the partial joint.  
12 There is an abundance of clinical evidence to support the  
13 use of a partial joint replacement system in this joint.  
14 CDRH should not substitute its judgment for the years of  
15 clinical experience with this device. Thank you.

16 MR. COLE: Thank you, Dr. Curry. We are running  
17 out of time and we have two very important presentations to  
18 make so I would like to move right into the results of both  
19 the prospective clinical study and the registry data, which  
20 we believe demonstrate that we have identified the patient  
21 population and demonstrated that the device is safe and  
22 effective for use in that patient population. To make the  
23 presentation on the clinical results, Doug Albrecht, the  
24 manager of clinical affairs at TMJ.

25 MR. ALBRECHT: Hi.

1 [Slide]

2 Right now, we have two data sets of patients that  
3 we are going to report on. One is our prospective clinical  
4 study, for which you received all the data that we have  
5 collected so far in your packet. What I am going to present  
6 here today is data regarding the indications for use  
7 compiled from that data.

8 [Slide]

9 To date, we have 113 patients with a partial joint  
10 replacement enrolled in the clinical study, and 109 of those  
11 are evaluable at this point. There were 4 recently enrolled  
12 patients for whom the data has not been collected yet.

13 The demographics are typical for this population  
14 of partial joint replacement, and in this group of patients  
15 75 percent of those patients have received stock implants.

16 [Slide]

17 Dr. Runner's question or statement that internal  
18 derangement was not a specific diagnosis was taken back to  
19 our investigators and we asked them, you know, can you give  
20 us some more specific information with regard to the  
21 diagnosis that was given. Originally they reported 81  
22 percent of the patients enrolled with a partial joint had  
23 internal derangement.

24 Upon revisiting this with the investigators, we  
25 found that the majority of the patients still have a

1 diagnosis of internal derangement, with about one-third with  
2 perforation, two-thirds without perforation, and about ten  
3 percent with inflammatory arthritis. The majority of those  
4 patients in the inflammatory arthritis group also had a  
5 secondary diagnosis of internal derangement. Therefore, we  
6 are looking at about 85 percent of the patients with a  
7 diagnosis of internal derangement that did receive a partial  
8 joint replacement.

9 [Slide]

10 Again, as Dr. Urbanek and the other surgeons have  
11 alluded to today, these patients exhaust most non-surgical  
12 modalities when they are indicated for the patient, and  
13 these can be any of these listed on this slide.

14 [Slide]

15 When they have exhausted the non-surgical  
16 modalities, we have found in this clinical study that for 82  
17 percent of the patients this is their first TMJ surgery, and  
18 the rest have had between one and six previous TMJ surgeries  
19 before receiving the prosthesis.

20 [Slide]

21 This graph is a graph of the pain reduction from  
22 the prospective study from those patients with internal  
23 derangement and with fibrosis and ankylosis. As you can  
24 see, they all start out with a pain level of 1-10, 10 being  
25 the most pain imaginable and zero being no pain at all.

1 They all start out at about a level of between 7 and 8 on  
2 this VAS scale, and within 3 months after surgery they have  
3 clinically significantly reduced their pain levels to about  
4 a 3 and this continues to go on for about 3 years post-  
5 implant.

6 [Slide]

7 The same is seen with the interincisal opening.  
8 Again, for those patients with internal derangements and  
9 fibrosis and ankylosis, they all begin about the same place,  
10 between 30-35 mm of opening, which is fairly acceptable for  
11 this group of patients. Immediately postop their opening  
12 does go down due to the postop complications, but then back  
13 up to about between 30-35 mm and this extends out to 3 years  
14 postop.

15 [Slide]

16 We have seen no unanticipated adverse device  
17 effects from this surgery. We have had one event that is  
18 related to catching of the joint, which may be attributed to  
19 the positioning of the implant by the surgeon, but  
20 everything else is associated with either surgical  
21 complications, disease progression or trauma.

22 [Slide]

23 We also track patients in our TMJ Implants  
24 registry. Upon registry, we ask physicians for historical  
25 information, as well as some diagnostic information but not

1 as detailed as the prospective study. In the TMJ registry  
2 we have collected pain and opening data on over 1300  
3 patients since 1993. In order to track as many patients  
4 with as complete data sets as possible, we have isolated a  
5 cohort of 88 subjects which have complete data from preop  
6 all the way out to 3 years of implant duration. That  
7 population, as stated here, is typical of the partial joint  
8 population as shown with the prospective study.

9 [Slide]

10 Again, we ask the physicians to provide us with  
11 the Wilkes classification upon registration of the device  
12 after surgery. These are the definitions, as we have  
13 alluded to before in presentations.

14 [Slide]

15 Out of the 88 patients, the surgeons for 46  
16 patients did report the Wilkes classification of class III  
17 or higher. We had no reports of I or II in this cohort  
18 group. Additionally, 50 out of the 88 patients reported  
19 surgical history, 36 percent of those having their first  
20 surgery at this point, and the remaining two-thirds of the  
21 patients had anywhere between 1-9 surgical procedures.

22 [Slide]

23 In looking at the cohort of 88 patients and the 46  
24 that did report the Wilkes classification, we see the same  
25 pain levels, starting at about 8 on a VAS scale of 1-10.

1 Within a month after surgery the pain is clinically  
2 significantly reduced, and this continues on out to 3 years  
3 post-surgery.

4 [Slide]

5 We see the same information again with the  
6 interincisal opening for the same group in class III, class  
7 IV or class V Wilkes classification. They start out at  
8 about 30 mm postop and then improve out to 3 years implant  
9 duration.

10 [Slide]

11 As I said before, we do have data on over 1300  
12 patients within the TMJ Implants registry. Out of those  
13 1300, over 800 surgeons returned the Wilkes classifications  
14 for their patients, and this graph represents the cross-  
15 section of that population. Cross-section means that we  
16 don't have the same patients followed at every time period.  
17 Because of the ongoing follow-up, patients either have not  
18 met that follow-up period or have been lost to follow-up.  
19 However, the numbers are fairly significant within the three  
20 classes of class III, class IV or class V.

21 [Slide]

22 We do again see a significant decrease in pain  
23 within the first month of surgery and that continues out to  
24 almost five years in implant duration.

25 [Slide]

1 We see the same information with regard to the  
2 interincisal opening with the class III, IV and V, with  
3 again significant improvement in opening out to 5 years  
4 implant duration.

5 [Slide]

6 With regard to any adverse device effects within  
7 the registry cohort of 88 patients, we have seen no  
8 unanticipated adverse events for this group of patients, and  
9 93 percent of these patients still have the original fossa-  
10 eminence implanted three years after surgery.

11 [Slide]

12 With the cross-section of the 1358 patients minus  
13 the cohort of 88 -- so, we have two separate populations,  
14 again, 93 percent still have their original prosthesis  
15 implanted after five years implant duration.

16 [Slide]

17 The big key here is reproducibility of the data.  
18 No matter how you cut the pie; no matter what population we  
19 have looked at, whether it is the prospective study, whether  
20 it is the registry or whether it is independent data from  
21 other surgeons, we see the same information time in, time  
22 out. Looking here at the prospective cross-section of the  
23 ongoing trial, I have also been able to isolate 21 patients  
24 in the prospective study with complete data through 2 years,  
25 as well as the registry cohort which is 88 patients out to 3

1 years, and we see the same information of a significant  
2 decrease in pain and that continues out long-term.

3 [Slide]

4 We see the same information from the same three  
5 groups of patients with regard to interincisal opening.

6 [Slide]

7 In conclusion, we believe that the Christensen  
8 partial joint replacement is effective for the indicated  
9 populations of internal derangement with and without  
10 perforation, and associated with inflammatory arthritis.  
11 These can be correlated to Wilkes class III, IV or V. We  
12 have shown that a small population of patients with fibrosis  
13 and ankylosis do improve with the implant, as well as  
14 patients that have failed previous TMJ surgery, either  
15 autograft or allograft.

16 [Slide]

17 Again, we believe that the device is safe for the  
18 indicated populations. The overwhelming majority still have  
19 the device implanted at least after three years after  
20 surgery and some out to five years. We have seen no  
21 unanticipated adverse device effects, and there is no  
22 evidence that has been presented that the device causes  
23 degeneration of the natural mandibular condyle. The  
24 clinical data do demonstrate that the metal-to-bone  
25 articulation will not cause degeneration to the natural

1 mandibular condyle. Thank you.

2 MR. COLE: Thank you, Doug. I know, Mr. Chairman,  
3 that we are virtually out of time. We have one more  
4 presentation that we wanted to make in response to comments  
5 made by the Food and Drug Administration in its submission  
6 to the panel that, in fact, no engineering data on the  
7 partial had been submitted. I don't know if you want to  
8 take two minutes to do that. I would like to confirm that,  
9 in fact, the report that we prepared in response to that  
10 statement was distributed to the panel. If so, that might  
11 suffice in place of the testimony.

12 DR. HEFFEZ: You actually have three minutes left,  
13 if you can be concise.

14 MR. COLE: I would like to introduce you to Mr.  
15 Durnell, one of the fastest talkers in the company, who will  
16 now very quickly go through the data on the partial joint  
17 that was in the premarket approval application.

18 MR. DURNELL: Thank you.

19 [Slide]

20 Good morning. I am here to summarize the  
21 preclinical testing which has been submitted in the PMA. A  
22 small percentage of the testing submitted in the original  
23 PMA was pertinent to a total joint system. However, the  
24 majority of the testing is relevant to both a partial and a  
25 total joint system, and was conducted either on

1 representative material samples and devices or on the actual  
2 devices themselves.

3           The justification for use of all of these various  
4 testing configurations was explained in the appropriate  
5 sections of the PMA, and there were four distinct testing  
6 configurations. One, we used the material sample of cobalt  
7 chrome. This we used for the tensile property testing and  
8 corrosion testing.

9           The second configuration was cast cobalt chrome  
10 condylar prosthesis. This is made from the same material,  
11 utilizing the same processing as the Fossa-Eminence  
12 Prosthesis, and for that we tested the perpendicular and 3-  
13 point bend testing, and the biocompatibility testing was  
14 conducted using an extraction from a condylar prosthesis.  
15 Those include the systemic tox, cytotox, mutagenicity,  
16 irritation and intracutaneous reactivity.

17           The actual fossa device against a condylar  
18 prosthesis as a worst case scenario -- the is justification  
19 for this as a worst case is that, number one, it represents  
20 a single point contact which concentrates the forces and,  
21 two, this configuration is a hard alloplast on a hard  
22 alloplast. For these tests, the following tests -- contact  
23 area, contact stress -- all of our wear testing was done  
24 using this worst case -- physiologic fatigue and, in  
25 response to discussions with the panel and the Center, we
